Re: Redington Mountain Wind Project (the "Project")

Dear Ms. Spencer-Famous:

As you know, Maine Mountain Power, LLC ("MMP") has recently submitted an application to the Maine Land Use Regulation Commission for approval to build the 90 MW Redington Mountain Wind Energy Project (the "Project") on Redington Pond Range and Black Nubble Mountains near Carrabassett Valley. We would like to take this opportunity to provide you with some additional information about MMP and its owners.

MMP is a joint development company between Endless Energy Corporation ("EEC") and Mission Wind Maine ("MWM"). MWM is a wholly owned project subsidiary of Edison Mission Energy ("EME" or "Edison"). MWM and EEC formed MMP to develop, finance, build, own and operate the Project. EME is funding the development of the project through its subsidiaries pursuant to a joint development agreement with EEC.

Upon issuance of all necessary permits, EME subsidiaries will fund and manage the construction and completion of the project through MMP. These activities are subject to customary conditions, such as issuance of necessary permits, legal documentation of construction agreements, and obtaining commitments for all other resources necessary to commence and complete construction.. We have already spent a great deal of time and effort on all these activities in addition to funding development costs, and we expect these conditions will be satisfied. Upon issuance of permits, MMP will be ready to start construction and we have every reason to believe the project will be completed on a timely basis.

Edison is uniquely well suited to acquire and finance the Project based on our long experience in wind energy, our capital strength and our ability to utilize the tax benefits from the project. In particular, Edison is among the leading developers, owners and operators of independent power projects in the United States, with total assets of approximately \$6.3 billion, and an independent power portfolio of about 9,000 MW, including wind, coal, and gas-fired projects.

In the U.S. wind energy sector, Edison is among the most active project developers/owners, with a current portfolio of 10 wind energy projects (in operation or construction) totaling about 480 MW, and with a substantial number of additional projects in advanced development stage. Edison has established a strategic plan to invest a target of \$1.2 billion in new large-

scale economically viable wind energy projects in the United States. The Redington Mountain Wind Project is a key component of that strategic plan.

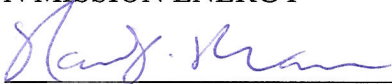

As you may know, the market for wind turbines in the U.S. is currently in a critically tight supply/demand situation, with many turbine vendors having sold out for the next several years. Consequently, as part of Edison's strategic plan and to support our wind projects under development, Edison has recently entered into procurement agreements covering a sizeable number of wind turbines from some of the leading equipment vendors. Upon commencement of construction, we anticipate that a sufficient number of these turbines would be allocated to the Redington Project.

The foregoing should provide sufficient information about Edison's experience and activities in wind energy, and about our participation in MMP. However, please let us know if you require additional information about Edison and our plans for the Project at this time.

Together with Endless Energy, we look forward to working toward successful completion of the Project.

Very truly yours,

EDISON MISSION ENERGY
