Notes:
< - Result not detected above laboratory reporting limit.
CAS - Chemical Abstracts Service.
FD - Field duplicate.
ft - feet.
J - Estimated value.
mg/kg - milligram per kilogram.
N - Normal sample.
PAH - Polycyclic Aromatic Hydrocarbon.
PCB - Polychlorinated Biphenyl.
SVOC - Semivolatile organic compound.
U - Not detected.
UJ - The analyte was not detected; and the reporting limit is approximate.
UR - Unreported/rejected.
VOC - Volatile organic compound.
(a) Lab calculated value; only used when individual compound data not available.
(b) Total concentrations for use in the risk assessment were calculated per sample by summing only the detected individual compounds (i.e., Aroclor/xylene) concentratio For samples without any detections of individual compounds (i.e., Aroclor/xylene), the maximum reporting detection limit within the sample is presented as a non-detect value. Calculated totals have a CAS number beginning with "RA-".
(c) Chromium III concentrations were calculated by the laboratory by subtracting chromium IV from total chromium, and were reported to two significant figures. Where chromium IV was not detected, the chromium III concentration was reported as the total chromium concentration at two significant figures.

Notes:
< - Result not detected above laboratory reporting limit.
CAS - Chemical Abstracts Service.
FD - Field duplicate.
ft - feet.
J - Estimated value.
mg/kg - milligram per kilogram.
N - Normal sample.
PAH - Polycyclic Aromatic Hydrocarbon.
PCB - Polychlorinated Biphenyl.
SVOC - Semivolatile organic compound.
U - Not detected.
UJ - The analyte was not detected; and the reporting limit is approximate.
UR - Unreported/rejected.
VOC - Volatile organic compound.
(a) Lab calculated value; only used when individual compound data not available.
(b) Total concentrations for use in the risk assessment were calculated per sample by summing only the detected individual compounds (i.e., Aroclor/xylene) concentratio For samples without any detections of individual compounds (i.e., Aroclor/xylene), the maximum reporting detection limit within the sample is presented as a non-detect value. Calculated totals have a CAS number beginning with "RA-".
(c) Chromium III concentrations were calculated by the laboratory by subtracting chromium IV from total chromium, and were reported to two significant figures. Where chromium IV was not detected, the chromium III concentration was reported as the total chromium concentration at two significant figures.

Notes:
< - Result not detected above laboratory reporting limit.
CAS - Chemical Abstracts Service.
FD - Field duplicate.
ft - feet.
J - Estimated value.
mg/kg - milligram per kilogram.
N - Normal sample.
PAH - Polycyclic Aromatic Hydrocarbon.
PCB - Polychlorinated Biphenyl.
SVOC - Semivolatile organic compound.
U - Not detected.
UJ - The analyte was not detected; and the reporting limit is approximate.
UR - Unreported/rejected.
VOC - Volatile organic compound.
(a) Lab calculated value; only used when individual compound data not available.
(b) Total concentrations for use in the risk assessment were calculated per sample by summing only the detected individual compounds (i.e., Aroclor/xylene) concentratio For samples without any detections of individual compounds (i.e., Aroclor/xylene), the maximum reporting detection limit within the sample is presented as a non-detect value. Calculated totals have a CAS number beginning with "RA-".
(c) Chromium III concentrations were calculated by the laboratory by subtracting chromium IV from total chromium, and were reported to two significant figures. Where chromium IV was not detected, the chromium III concentration was reported as the total chromium concentration at two significant figures.

Notes:
< - Result not detected above laboratory reporting limit.
CAS - Chemical Abstracts Service.
FD - Field duplicate.
ft - feet.
J - Estimated value.
mg/kg - milligram per kilogram.
N - Normal sample.
PAH - Polycyclic Aromatic Hydrocarbon.
PCB - Polychlorinated Biphenyl.
SVOC - Semivolatile organic compound.
U - Not detected.
UJ - The analyte was not detected; and the reporting limit is approximate.
UR - Unreported/rejected.
VOC - Volatile organic compound.
(a) Lab calculated value; only used when individual compound data not available.
(b) Total concentrations for use in the risk assessment were calculated per sample by summing only the detected individual compounds (i.e., Aroclor/xylene) concentratio For samples without any detections of individual compounds (i.e., Aroclor/xylene), the maximum reporting detection limit within the sample is presented as a non-detect value. Calculated totals have a CAS number beginning with "RA-".
(c) Chromium III concentrations were calculated by the laboratory by subtracting chromium IV from total chromium, and were reported to two significant figures. Where chromium IV was not detected, the chromium III concentration was reported as the total chromium concentration at two significant figures.

Notes:
< - Result not detected above laboratory reporting limit.
CAS - Chemical Abstracts Service.
FD - Field duplicate.
ft - feet.
J - Estimated value.
mg/kg - milligram per kilogram.
N - Normal sample.
PAH - Polycyclic Aromatic Hydrocarbon.
PCB - Polychlorinated Biphenyl.
SVOC - Semivolatile organic compound.
U - Not detected.
UJ - The analyte was not detected; and the reporting limit is approximate.
UR - Unreported/rejected.
VOC - Volatile organic compound.
(a) Lab calculated value; only used when individual compound data not available.
(b) Total concentrations for use in the risk assessment were calculated per sample by summing only the detected individual compounds (i.e., Aroclor/xylene) concentratio For samples without any detections of individual compounds (i.e., Aroclor/xylene), the maximum reporting detection limit within the sample is presented as a non-detect value. Calculated totals have a CAS number beginning with "RA-".
(c) Chromium III concentrations were calculated by the laboratory by subtracting chromium IV from total chromium, and were reported to two significant figures. Where chromium IV was not detected, the chromium III concentration was reported as the total chromium concentration at two significant figures.

Notes:
< - Result not detected above laboratory reporting limit.
CAS - Chemical Abstracts Service.
FD - Field duplicate.
ft - feet.
J - Estimated value.
mg/kg - milligram per kilogram.
N - Normal sample.
PAH - Polycyclic Aromatic Hydrocarbon.
PCB - Polychlorinated Biphenyl.
SVOC - Semivolatile organic compound.
U - Not detected.
UJ - The analyte was not detected; and the reporting limit is approximate.
UR - Unreported/rejected.
VOC - Volatile organic compound.
(a) Lab calculated value; only used when individual compound data not available.
(b) Total concentrations for use in the risk assessment were calculated per sample by summing only the detected individual compounds (i.e., Aroclor/xylene) concentratio For samples without any detections of individual compounds (i.e., Aroclor/xylene), the maximum reporting detection limit within the sample is presented as a non-detect value. Calculated totals have a CAS number beginning with "RA-".
(c) Chromium III concentrations were calculated by the laboratory by subtracting chromium IV from total chromium, and were reported to two significant figures. Where chromium IV was not detected, the chromium III concentration was reported as the total chromium concentration at two significant figures.

Notes:
< - Result not detected above laboratory reporting limit.
CAS - Chemical Abstracts Service.
FD - Field duplicate.
ft - feet.
J - Estimated value.
mg/kg - milligram per kilogram.
N - Normal sample.
PAH - Polycyclic Aromatic Hydrocarbon.
PCB - Polychlorinated Biphenyl.
SVOC - Semivolatile organic compound.
U - Not detected.
UJ - The analyte was not detected; and the reporting limit is approximate.
UR - Unreported/rejected.
VOC - Volatile organic compound.
(a) Lab calculated value; only used when individual compound data not available.
(b) Total concentrations for use in the risk assessment were calculated per sample by summing only the detected individual compounds (i.e., Aroclor/xylene) concentrati For samples without any detections of individual compounds (i.e., Aroclor/xylene), the maximum reporting detection limit within the sample is presented as a non-detect value. Calculated totals have a CAS number beginning with "RA-".
(c) Chromium III concentrations were calculated by the laboratory by subtracting chromium IV from total chromium, and were reported to two significant figures. Where chromium IV was not detected, the chromium III concentration was reported as the total chromium concentration at two significant figures.

Notes:
< - Result not detected above laboratory reporting limit.
CAS - Chemical Abstracts Service.
FD - Field duplicate.
ft - feet.
J - Estimated value.
mg/kg - milligram per kilogram.
N - Normal sample.
PAH - Polycyclic Aromatic Hydrocarbon.
PCB - Polychlorinated Biphenyl.
SVOC - Semivolatile organic compound.
U - Not detected.
UJ - The analyte was not detected; and the reporting limit is approximate.
UR - Unreported/rejected.
VOC - Volatile organic compound.
(a) Lab calculated value; only used when individual compound data not available.
(b) Total concentrations for use in the risk assessment were calculated per sample by summing only the detected individual compounds (i.e., Aroclor/xylene) concentrati For samples without any detections of individual compounds (i.e., Aroclor/xylene), the maximum reporting detection limit within the sample is presented as a non-detect value. Calculated totals have a CAS number beginning with "RA-".
(c) Chromium III concentrations were calculated by the laboratory by subtracting chromium IV from total chromium, and were reported to two significant figures. Where chromium IV was not detected, the chromium III concentration was reported as the total chromium concentration at two significant figures.

Notes:
< - Result not detected above laboratory reporting limit.
CAS - Chemical Abstracts Service.
FD - Field duplicate.
ft - feet.
J - Estimated value.
mg/kg - milligram per kilogram.
N - Normal sample.
PAH - Polycyclic Aromatic Hydrocarbon.
PCB - Polychlorinated Biphenyl.
SVOC - Semivolatile organic compound.
U - Not detected.
UJ - The analyte was not detected; and the reporting limit is approximate.
UR - Unreported/rejected.
VOC - Volatile organic compound.
(a) Lab calculated value; only used when individual compound data not available.
(b) Total concentrations for use in the risk assessment were calculated per sample by summing only the detected individual compounds (i.e., Aroclor/xylene) concentratic For samples without any detections of individual compounds (i.e., Aroclor/xylene), the maximum reporting detection limit within the sample is presented as a non-detect value. Calculated totals have a CAS number beginning with "RA-".
(c) Chromium III concentrations were calculated by the laboratory by subtracting chromium IV from total chromium, and were reported to two significant figures. Where chromium IV was not detected, the chromium III concentration was reported as the total chromium concentration at two significant figures.

Notes:
< - Result not detected above laboratory reporting limit.
CAS - Chemical Abstracts Service.
FD - Field duplicate.
ft - feet.
J - Estimated value.
mg/kg - milligram per kilogram.
N - Normal sample.
PAH - Polycyclic Aromatic Hydrocarbon.
PCB - Polychlorinated Biphenyl.
SVOC - Semivolatile organic compound.
U - Not detected.
UJ - The analyte was not detected; and the reporting limit is approximate.
UR - Unreported/rejected.
VOC - Volatile organic compound.
(a) Lab calculated value; only used when individual compound data not available.
(b) Total concentrations for use in the risk assessment were calculated per sample by summing only the detected individual compounds (i.e., Aroclor/xylene) concentrati For samples without any detections of individual compounds (i.e., Aroclor/xylene), the maximum reporting detection limit within the sample is presented as a non-detect value. Calculated totals have a CAS number beginning with "RA-".
(c) Chromium III concentrations were calculated by the laboratory by subtracting chromium IV from total chromium, and were reported to two significant figures. Where chromium IV was not detected, the chromium III concentration was reported as the total chromium concentration at two significant figures.

Notes:
< - Result not detected above laboratory reporting limit.
CAS - Chemical Abstracts Service.
FD - Field duplicate.
ft - feet.
J - Estimated value.
mg/kg - milligram per kilogram.
N - Normal sample.
PAH - Polycyclic Aromatic Hydrocarbon.
PCB - Polychlorinated Biphenyl.
SVOC - Semivolatile organic compound.
U - Not detected.
UJ - The analyte was not detected; and the reporting limit is approximate.
UR - Unreported/rejected.
VOC - Volatile organic compound.
(a) Lab calculated value; only used when individual compound data not available.
(b) Total concentrations for use in the risk assessment were calculated per sample by summing only the detected individual compounds (i.e., Aroclor/xylene) concentratio For samples without any detections of individual compounds (i.e., Aroclor/xylene), the maximum reporting detection limit within the sample is presented as a non-detect value. Calculated totals have a CAS number beginning with "RA-".
(c) Chromium III concentrations were calculated by the laboratory by subtracting chromium IV from total chromium, and were reported to two significant figures. Where chromium IV was not detected, the chromium III concentration was reported as the total chromium concentration at two significant figures.

XYLENES, TOTAL (a)	1330-20-7	mg/kg																
XYLENES, TOTAL CALC (b)	RA-1330-20-7	mg/kg																
			9	9	9	9	9	9	9	9	9	9	9	9	9	60	60	9

Notes:
< - Result not detected above laboratory reporting limit.
CAS - Chemical Abstracts Service.
FD - Field duplicate.
ft - feet.
J - Estimated value.
mg/kg - milligram per kilogram.
N - Normal sample.
PAH - Polycyclic Aromatic Hydrocarbon.
PCB - Polychlorinated Biphenyl.
SVOC - Semivolatile organic compound.
U - Not detected.
UJ - The analyte was not detected; and the reporting limit is approximate.
UR - Unreported/rejected.
VOC - Volatile organic compound.
(a) Lab calculated value; only used when individual compound data not available.
(b) Total concentrations for use in the risk assessment were calculated per sample by summing only the detected individual compounds (i.e., Aroclor/xylene) concentratio For samples without any detections of individual compounds (i.e., Aroclor/xylene), the maximum reporting detection limit within the sample is presented as a non-detect value. Calculated totals have a CAS number beginning with "RA-".
(c) Chromium III concentrations were calculated by the laboratory by subtracting chromium IV from total chromium, and were reported to two significant figures. Where chromium IV was not detected, the chromium III concentration was reported as the total chromium concentration at two significant figures.

Notes:
< - Result not detected above laboratory reporting limit.
CAS - Chemical Abstracts Service.
FD - Field duplicate.
ft - feet.
J - Estimated value.
mg/kg - milligram per kilogram.
N - Normal sample.
PAH - Polycyclic Aromatic Hydrocarbon.
PCB - Polychlorinated Biphenyl.
SVOC - Semivolatile organic compound.
U - Not detected.
UJ - The analyte was not detected; and the reporting limit is approximate.
UR - Unreported/rejected.
VOC - Volatile organic compound.
(a) Lab calculated value; only used when individual compound data not available.
(b) Total concentrations for use in the risk assessment were calculated per sample by summing only the detected individual compounds (i.e., Aroclor/xylene) concentrati For samples without any detections of individual compounds (i.e., Aroclor/xylene), the maximum reporting detection limit within the sample is presented as a non-detect value. Calculated totals have a CAS number beginning with "RA-".
(c) Chromium III concentrations were calculated by the laboratory by subtracting chromium IV from total chromium, and were reported to two significant figures. Where chromium IV was not detected, the chromium III concentration was reported as the total chromium concentration at two significant figures.

Notes:
< - Result not detected above laboratory reporting limit.
CAS - Chemical Abstracts Service.
FD - Field duplicate.
ft - feet.
J - Estimated value.
mg/kg - milligram per kilogram.
N - Normal sample.
PAH - Polycyclic Aromatic Hydrocarbon.
PCB - Polychlorinated Biphenyl.
SVOC - Semivolatile organic compound.
U - Not detected.
UJ - The analyte was not detected; and the reporting limit is approximate.
UR - Unreported/rejected.
VOC - Volatile organic compound.
(a) Lab calculated value; only used when individual compound data not available.
(b) Total concentrations for use in the risk assessment were calculated per sample by summing only the detected individual compounds (i.e., Aroclor/xylene) concentratio For samples without any detections of individual compounds (i.e., Aroclor/xylene), the maximum reporting detection limit within the sample is presented as a non-detect value. Calculated totals have a CAS number beginning with "RA-".
(c) Chromium III concentrations were calculated by the laboratory by subtracting chromium IV from total chromium, and were reported to two significant figures. Where chromium IV was not detected, the chromium III concentration was reported as the total chromium concentration at two significant figures.

				9	9	9	9

Notes:
< - Result not detected above laboratory reporting limit.
CAS - Chemical Abstracts Service.
FD - Field duplicate.
ft - feet.
J - Estimated value.
mg/kg - milligram per kilogram.
N - Normal sample.
PAH - Polycyclic Aromatic Hydrocarbon.
PCB - Polychlorinated Biphenyl.
SVOC - Semivolatile organic compound.
U - Not detected.
UJ - The analyte was not detected; and the reporting limit is approximate.
UR - Unreported/rejected.
VOC - Volatile organic compound.
(a) Lab calculated value; only used when individual compound data not available.
(b) Total concentrations for use in the risk assessment were calculated per sample by summing only the detected individual compounds (i.e., Aroclor/xylene) concentratio For samples without any detections of individual compounds (i.e., Aroclor/xylene), the maximum reporting detection limit within the sample is presented as a non-detect value. Calculated totals have a CAS number beginning with "RA-".
(c) Chromium III concentrations were calculated by the laboratory by subtracting chromium IV from total chromium, and were reported to two significant figures. Where chromium IV was not detected, the chromium III concentration was reported as the total chromium concentration at two significant figures.

Notes:

< - Result not detected above laboratory reporting limit.

CAS - Chemical Abstracts Service.

B - The analyte was found in the associated blank at a significant level relative to the sample result.

D - The reported value is from a dilution.

E - The reported value exceeded the instrument calibration range; estimated value.

FD - Field duplicate.

J - Estimated value.

N - Normal sample.

PCB - Polychlorinated Biphenyl.

PFASs - Poly- and Perfluoroalkyl Substances.

SVOC - Semivolatile organic compound.

ug/L - microgram per liter.

U - Not detected.

UJ - The analyte was not detected; and the reporting limit is approximate.

UR - Unreported/rejected.

VOC - Volatile organic compound.

(a) Lab calculated value; only used when individual compound data not available.

(b) Total concentrations for use in the risk assessment were calculated per sample by summing only the detected individual compounds (i.e., Aroclor/xylene) concentrations. For samples without any detections of individual compounds (i.e., Aroclor/xylene), the maximum reporting detection limit within the sample is presented as a non-detect value. Calculated totals have a CAS number beginning with "RA-".

Notes:

< - Result not detected above laboratory reporting limit.

CAS - Chemical Abstracts Service.

B - The analyte was found in the associated blank at a significant level relative to the sample result.

D - The reported value is from a dilution.

E - The reported value exceeded the instrument calibration range; estimated value.

FD - Field duplicate.

J - Estimated value.

N - Normal sample.

PCB - Polychlorinated Biphenyl.

PFASs - Poly- and Perfluoroalkyl Substances.

SVOC - Semivolatile organic compound.

ug/L - microgram per liter.

U - Not detected.

UJ - The analyte was not detected; and the reporting limit is approximate.

UR - Unreported/rejected.

VOC - Volatile organic compound.

(a) Lab calculated value; only used when individual compound data not available.

(b) Total concentrations for use in the risk assessment were calculated per sample by summing only the detected individual compounds (i.e., Aroclor/xylene) concentrations. For samples without any detections of individual compounds (i.e., Aroclor/xylene), the maximum reporting detection limit within the sample is presented as a non-detect value. Calculated totals have a CAS number beginning with "RA-".

Notes:

< - Result not detected above laboratory reporting limit.

CAS - Chemical Abstracts Service.

B - The analyte was found in the associated blank at a significant level relative to the sample result.

D - The reported value is from a dilution.

E - The reported value exceeded the instrument calibration range; estimated value.

FD - Field duplicate.

J - Estimated value.

N - Normal sample.

PCB - Polychlorinated Biphenyl.

PFASs - Poly- and Perfluoroalkyl Substances.

SVOC - Semivolatile organic compound.

ug/L - microgram per liter.

U - Not detected.

UJ - The analyte was not detected; and the reporting limit is approximate.

UR - Unreported/rejected.

VOC - Volatile organic compound.

(a) Lab calculated value; only used when individual compound data not available.

(b) Total concentrations for use in the risk assessment were calculated per sample by summing only the detected individual compounds (i.e., Aroclor/xylene) concentrations. For samples without any detections of individual compounds (i.e., Aroclor/xylene), the maximum reporting detection limit within the sample is presented as a non-detect value. Calculated totals have a CAS number beginning with "RA-".

Notes:
< - Result not detected above laboratory reporting limit.
CAS - Chemical Abstracts Service.
FD - Field duplicate.
J - Estimated value.
N - Normal sample.
PCB - Polychlorinated Biphenyl.
SVOC - Semivolatile organic compound.
ug/L - microgram per liter.
U - Not detected.
UJ - The analyte was not detected; and the reporting limit is approximate.
UR - Unreported/rejected.
VOC - Volatile organic compound.
(a) Lab calculated value; only used when individual compound data not available.
(b) Total concentrations for use in the risk assessment were calculated per sample by summing only the detected individual compounds (i.e., Aroclor/xylene) concentrations. For samples without any detections of individual compounds (i.e., Aroclor/xylene), the maximum reporting detection limit within the sample is presented as a non-detect value. Calculated totals have a CAS number beginning with "RA-".

Notes:
< - Result not detected above laboratory reporting limit.
CAS - Chemical Abstracts Service.
FD - Field duplicate.
ft - feet.
J - Estimated value.
mg/kg - milligram per kilogram.
N - Normal sample.
PCB - Polychlorinated Biphenyl.
SVOC - Semivolatile organic compound.
U - Not detected.
UJ - The analyte was not detected; and the reporting limit is approximate.
UR - Unreported/rejected.
VOC - Volatile organic compound.
(a) Lab calculated value; only used when individual compound data not available.
(b) Total concentrations for use in the risk assessment were calculated per sample by summing only the detected individual compounds (i.e., Aroclor/xylene) concentrations. For samples without any detections of individual compounds (i.e., Aroclor/xylene), the maximum reporting detection limit within the sample is presented as a non-detect value. Calculated totals have a CAS number beginning with "RA-".
(c) Chromium III concentrations were calculated by the laboratory by subtracting chromium IV from total chromium, and were reported to two significant figures. Where chromium IV was not detected, the chromium III concentration was reported as the total chromium concentration at two significant figures.

97.5% Chebyshev(Mean, Sd) UCL	21113	99% Chebyshev(Mean, Sd) UCL	26380
Suggested UCL to Use			
95% Student's-t UCL	14841		
Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.			
Recommendations are based upon data size, data distribution, and skewness.			
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).			
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.			
Note: For highly negatively-skewed data, confidence limits (e.g., Chen, Johnson, Lognormal, and Gamma) may not be reliable. Chen's and Johnson's methods provide adjustments for positvely skewed data sets.			

ARSENIC

Suggested UCL to Use			
95% Adjusted Gamma UCL	14.99		
When a data set follows an approximate (e.g., normal) distribution passing one of the GOF test			
When applicable, it is suggested to use a UCL based upon a distribution (e.g., gamma) passing both GOF tests in ProUCL			
Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.			
Recommendations are based upon data size, data distribution, and skewness.			
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).			
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

Suggested UCL to Use			
95% Student's-t UCL	22053	or 95% Modified-t UCL	21927
Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.			
Recommendations are based upon data size, data distribution, and skewness.			
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).			
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.			
Note: For highly negatively-skewed data, confidence limits (e.g., Chen, Johnson, Lognormal, and Gamma) may not be reliable. Chen's and Johnson's methods provide adjustments for positvely skewed data sets.

Gamma ROS Statistics using Imputed Non-Detects			
GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs			
GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)			
For such situations, GROS method may yield incorrect values of UCLs and BTVs			
This is especially true when the sample size is small.			
For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates			
Minimum	0.01	Mean	0.169

Suggested UCL to Use			
95% Student's-t UCL	16094		
Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.			
Recommendations are based upon data size, data distribution, and skewness.			
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).			
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.			
Note: For highly negatively-skewed data, confidence limits (e.g., Chen, Johnson, Lognormal, and Gamma) may not be reliable. Chen's and Johnson's methods provide adjustments for positvely skewed data sets.

Mean (detects)	0.094		
Gamma ROS Statistics using Imputed Non-Detects			
GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs			
GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)			
For such situations, GROS method may yield incorrect values of UCLs and BTVs			
This is especially true when the sample size is small.			
For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.			
Recommendations are based upon data size, data distribution, and skewness.			
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).			
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.			
Note: For highly negatively-skewed data, confidence limits (e.g., Chen, Johnson, Lognormal, and Gamma) may not be reliable. Chen's and Johnson's methods provide adjustments for positvely skewed data sets.

When a data set follows an approximate (e.g., normal) distribution passing one of the GOF test			
When applicable, it is suggested to use a UCL based upon a distribution (e.g., gamma) passing both GOF tests in ProUCL			
Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.			
Recommendations are based upon data size, data distribution, and skewness.			
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).			
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

Suggested UCL to Use			
95% KM (t) UCL	0.0106		
When a data set follows an approximate (e.g., normal) distribution passing one of the GOF test			
When applicable, it is suggested to use a UCL based upon a distribution (e.g., gamma) passing both GOF tests in ProUCL			
Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.			
Recommendations are based upon data size, data distribution, and skewness.			
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).			
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).			
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.			
ProUCL computes and outputs H-statistic based UCLs for historical reasons only.			
H-statistic often results in unstable (both high and low) values of UCL95 as shown in examples in the Technical Guide.			
It is therefore recommended to avoid the use of H-statistic based 95% UCLs.			
Use of nonparametric methods are preferred to compute UCL95 for skewed data sets which do not follow a gamma distribution.

However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.			
ProUCL computes and outputs H-statistic based UCLs for historical reasons only.			
H-statistic often results in unstable (both high and low) values of UCL95 as shown in examples in the Technical Guide.			
It is therefore recommended to avoid the use of H-statistic based 95% UCLs.			
Use of nonparametric methods are preferred to compute UCL95 for skewed data sets which do not follow a gamma distribution.

Gamma ROS Statistics using Imputed Non-Detects			
GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs			
GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)			
For such situations, GROS method may yield incorrect values of UCLs and BTVs			
This is especially true when the sample size is small.			
For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

95% KM (t) UCL	0.116		
When a data set follows an approximate (e.g., normal) distribution passing one of the GOF test			
When applicable, it is suggested to use a UCL based upon a distribution (e.g., gamma) passing both GOF tests in ProUCL			
Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.			
Recommendations are based upon data size, data distribution, and skewness.			
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).			
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

Gamma ROS Statistics using Imputed Non-Detects			
GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs			
GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)			
For such situations, GROS method may yield incorrect values of UCLs and BTVs			
This is especially true when the sample size is small.			
For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Mean (detects)	4.967		
Gamma ROS Statistics using Imputed Non-Detects			
GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs			
GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)			
For such situations, GROS method may yield incorrect values of UCLs and BTVs			
This is especially true when the sample size is small.			
For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Nonparametric Distribution Free UCL Statistics			
Detected Data appear Approximate Normal Distributed at 5% Significance Level			
Suggested UCL to Use			
95% KM (t) UCL	5.196		
When a data set follows an approximate (e.g., normal) distribution passing one of the GOF test			
When applicable, it is suggested to use a UCL based upon a distribution (e.g., gamma) passing both GOF tests in ProUCL			
Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.			
Recommendations are based upon data size, data distribution, and skewness.			
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).			
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

(e) USEPA, 2004. Risk Assessment Guidance for Superfund. Vol. 1, Part E. July, 2004. Equation A-4. Default value.

(f) USEPA, 2004. Risk Assessment Guidance for Superfund. Vol. 1, Part E. July, 2004. Exhibit B-2.
Values for trans-1,2-dichloroethene used for cis-1,2-dichloroethene.

(g) Dermal pathway is considered to be negligible, therefore, the dermal exposure pathway is not quantitatively evaluated, as discussed in the report text.

Equations:

USEPA, 2004. Risk Assessment Guidance for Superfund. Volume 1, Part E, Supplemental Guidance for Dermal Risk Assessment

Equation 3.8:	$\text{Log } Kp = -2.80 + 0.66 \log Kow - 0.0056\ MW$
Equation A.1:	$B = Kp \times MW^{0.5}/2.6$
Equation A.2:	$\text{Log Dsc/lsc} = -2.8\text{-}0.0056\ MW$, where lsc = 1E-3 cm. Solving for Dsc: $Dsc = 10^{-2.8\text{-}0.0056\ MW} * lsc$.
Equation A.4:	$t = lsc^2/(6*Dsc)$
Equation A.5:	If $B \leq 0.6$, Equation A.5: $t^* = 2.4* t$
Equation A.6:	If $B > 0.6$: $t^* = (b\text{-}(b^2\text{-}c^2)^{0.5}) * l^2sc/(Dsc)$
Equation A-7:	$b = (2*(1+B)^2/p) - c$
Equation A-8:	$c = (1+3B+3B^2)/(3*(1+B))$

Definitions:

B - Relative Contribution of Permeability Coefficient.
Dsc - Effective diffusion coefficent through stratum corneum.
FA - Fraction Absorbed.
Kow - Octanol-Water Partition Coefficient.
Kp - Dermal Permeability Coefficient.
lsc - Apparent thickness of stratum corneum.
MW - Molecular Weight.
t - lag time (hr/event).
t* - Time to reach steady state.

TRENCH MODEL

ATTACHMENT D

CALCULATION OF EXCAVATION AIR VOC ATTENUATION FACTORS FROM STANDING WATER-EXCAVATION TRENCH

Excavation trench air concentrations of a COPC resulting from volatilization from groundwater and leachate infiltrating an excavation trench can be predicted by the use of the method recommended by USEPA (1994) for predicting volatilization from standing water.

Air Concentration

In this model, the air concentration of a COPC is estimated at the downwind boundary of the water. For the purposes of calculating this concentration, a rectangular box with the base corresponding to the water surface is considered. The height of the box, H_b, is the height to which the chemical emissions from the water surface are uniformly mixed with the air. W_b is the width of the box perpendicular to the airflow. If U is the wind speed along the length of the trench, then, by conservation of mass, the air concentration, C_a, of chemical within the box is given by:

$$C_a = \frac{Q}{H_b W_b U} \quad (1)$$

The diffusion height, H_b, above the water surface is approximately equal to 5% of the length of the trench, i.e., parallel to the wind flow (Jackson, 1976). If the length of the trench is expressed as the surface area of the water on the bottom of the trench divided by the trench width, the equation for the air concentration becomes:

$$C_a = \frac{Q}{0.05\,AU} \quad (2)$$

where:

Q = chemical emission rate (g/s)

A = water surface area (m^2)

U = wind speed along the trench (m/s)

The chemical emission rate, Q, can be expressed as follows:

$$Q = KAC_L \quad (3)$$

where:

Q = chemical emission rate (g/s)

K = overall mass transfer coefficient (m/s)

A = water surface area (m^2)

C_L = chemical concentration in water (g/m^3)

With the substitution of equation (3) into equation (2), the equation for air concentration simplifies to:

$$C_a = \frac{KC_L}{0.05\,U} \quad (4)$$

For the purpose of calculating the concentration in air from a given concentration in water, it is convenient to use this equation to define an **attenuation factor**, α, defined as the ratio of the airborne concentration of the COPC above the water to the COPC concentration in the water. If the air and water COPC concentrations are in the same units α is dimensionless. If, as is common practice, the concentration in water is expressed in mass units per liter (L) and the air concentration is expressed as mass units per cubic meter (m^3), then the attenuation factor can be expressed as:

$$\alpha\ (L/m^3) = \frac{20000K}{U} \quad (5)$$

In applying the attenuation factor, the computation of the COPC air concentration requires the COPC concentration in water, wind speed and mass transfer coefficient.

Mass Transfer Coefficient

Volatilization is considered the primary pathway of mass transfer from the liquid to the vapor phase. It occurs when molecules of a dissolved substance escape to the gas phase due to a concentration gradient. The mass transfer coefficient is defined by USEPA (1994) as follows:

$$K = \left[\frac{1}{k_l^o \left(\frac{D_l^c}{D_l^o} \right)^m} + \frac{RT}{(10^6) H \; k_g^w \left(\frac{D_g^c}{D_g^w} \right)^n} \right]^{-1} \quad (6)$$

Where:

k_l^o = mass transfer coefficient of oxygen in water, cm/s;

D_l = diffusivity of the chemical (c) or oxygen (o) in water, cm^2/s;

m = liquid turbulence exponent, 0.5 to 1, dimensionless;

R = ideal gas constant, atm cm^3/ (mol.K);

T = temperature, K;

H = Henry's law constant, atm m^3/mol;

k_w^g = mass transfer coefficient for water vapor in air, cm/s;

D_g = diffusivity of the chemical (c) or water (w) in air, cm^2/s;

n = gas turbulence exponent, 0.5 to 1.0, dimensionless

The elements of this equation can be described by:

$$K = \left[\frac{1}{K_L} + \frac{1}{K_G K_{eq}} \right]^{-1} \quad (7)$$

where,

K_L = Liquid phase mass transfer coefficient, cm/s;

K_G = Gas phase mass transfer coefficient, cm/s;

K_{eq} = Equilibrium mass transfer coefficient, unit less;

K_L, K_G and K_{eq} may be expressed as follows:

$$K_{eq} = \frac{H}{RT} \quad (8)$$

$$K_L = k_l^o \left(\frac{D_l^c}{D_l^o} \right)^m \quad (9)$$

$$K_G = k_g^w \left(\frac{D_g^c}{D_g^o} \right)^n \quad (10)$$

Equation 6 requires values of diffusion coefficients and Henry's law constants which are presented in the accompanying table. The constants used in Equation 6 are presented below.

Values of Constants for use in Equation 6 (Source: USEPA (1994), Table 2-1):

Constant	Value for Lakes
k_l^o (cm/s)	0.0005
m	1.0
T (K)	293
RT (cm^3.atm/mol)	24042.4
k_w^g (cm/s)	0.58
n	0.7

Model Applications and Results

The accompanying table provides model inputs and the intermediate steps in the process of modeling the attenuation factor. A surface wind speed of 2.25 m/s was applied (ASTM, 1994).

DEVELOPMENT OF ATTENUATION FACTORS FOR THE GROUNDWATER TO EXCAVATION TRENCH AIR PATHWAY
FIRE TRAINING AREA, NCTAMS LANT DET CUTLER
CUTLER, MAINE

Assumption: Losses from a trench occur in a manner similar to volatilization losses from a lake; using equation 2-4 from the "Air Emissions Models for the Waste and Wastewater"; EPA, Nov. 1994.
The overall mass transfer coefficient, K is calculated as follows:

$$K = [1/(k_l^o * (D_l^c/D_l^o)^m) + (RT/(10^6*H*K_g^w*(D_g^c/D_g^w)^n))]^{-1}$$ ------ (1) (a)

$$K = (B+C)^{-1}$$; Where

$$B = 1/(k_l^o * (D_l^c/D_l^o)^m)$$ and

$$C = (RT/(10^6*H*K_g^w*(D_g^c/D_g^w)^n))$$

SHOWER MODEL

Attachment D

Shower Air Concentrations

The showering inhalation pathway requires modeling to derive exposure point concentrations. Foster and Chrostowski (1987) have presented a predictive model to estimate an indoor (bathroom) concentration. This theoretical approach is based on the experimental work of Andelman (1985), who measured air concentrations of trichloroethylene and chloroform in a bench scale shower assembly.

The shower model utilizes several assumptions, including a 12 cubic meter (m^3) bathroom volume and instant equilibrium in the air between the shower stall and the rest of the bathroom. The volumetric flow rate through the bathroom was assumed to be 0.1 m^3/min. This gives an effective air change rate of 0.5 air changes/hour (ACH). This value represents a reasonably conservative estimate given that median values for homes with closed windows is about 0.5 ACH (TRJ Environmental, 2002), and bathrooms with showers generally need a greater air exchange rate to remove moisture. No modifications were made to the model assumptions for this evaluation.

The model calculates the maximum concentrations, assuming that exposure time equals duration of the shower use. In reality, an individual would experience an integrated exposure that would gradually increase during shower usage and decrease again after the water was turned off. It was conservatively assumed that the peak concentration would persist for the entire duration of exposure.

The equation to calculate air concentrations in the bathroom is shown below:

$$C_{VOC} = \frac{S\,(e^{RDs} - 1)(e^{-Rt})}{R} \qquad \text{(Eq. 1)}$$

where:

C_{VOC} = bathroom VOC air concentration, ug/m^3
S = VOC source generation rate, ug/m^3- minute
R = air exchange rate of bathroom, min^{-1}
t = time at which concentration is being calculated, min
D_s = duration of shower, min

R, the air exchange rate, is calculated as the volumetric flow rate through the bathroom (m^3/min) divided by the volume of the bathroom (m^3).

S, the VOC source generation rate, is calculated based on the concentration of the compound in the water, emission of compound from a droplet, flow rate of water, and volume of room for dilution. S is calculated from the following series of equations:

$$S = \frac{C_{wd}\, Fr}{S_v} \qquad \text{(Eq. 2)}$$

where:

S = VOC source generation rate, ug/m^3-min
C_{wd} = concentration of VOC leaving the shower droplet, µg/l
F_r = water flow rate in shower, 10 liters/min
S_v = shower volume, 2.94 m^3

C_{wd} is calculated as follows:

$$C_{wd} = C_{wc} * (1 - e^{[(-KaL)(ts)/600d]}) \qquad \text{(Eq. 3)}$$

Where:

C_{wc} = concentration of VOC in water, µg/l
K_{aL} = temperature-connected mass transfer coefficient, cm/hr
t_s = shower droplet drop time, 2 sec
d = droplet diameter, 0.1 cm
1/600d = 6/d (mm) * (1 hr/3600 sec)

K_{aL} is calculated according to:

$$K_{aL} = K_L * [(T_1 * u_s)/(T_s * u_1)]^{-0.5} \qquad \text{(Eq. 4)}$$

Where:

K_L = mass transfer coefficient at reference conditions (20°C and 1 atm), cm/hr
T_1 = reference temperature, 293°K
T_s = temperature of shower water, 318°K
u_1 = viscosity of water at reference temperature, 1.002 cp
u_s = viscosity of water at shower temperature, 0.5960 cp

K_L is calculated according to:

$$K_L = 1/[1/k_I + RT/(H\, k_g)] \qquad \text{(Eq. 5)}$$

Where:

k_I = liquid-film mass transfer, cm/hr
k_g = gas-film mass transfer, cm/hr
H = Henry's Law constant, atm-m^3/mole
R = molar gas constant, 8.191×10^{-5} atm-m^3/mole-k
T = temperature, 293°K

The input values of k_I and k_g are based on the mass transfer coefficients of carbon dioxide (CO_2) and water. They are calculated for the particular constituent of potential interest according to the following equations:

$$k_I = (kCO_2)\,[(44g/mole)/MW_{VOC}]^{0.5} \qquad \text{(Eq. 6)}$$

$$k_g = (kH_2O)\,[(18g/mole)/MW_{VOC}]^{0.5} \qquad \text{(Eq. 7)}$$

where:

kCO_2 = 20 cm/hr
kH_2O = 3,000 cm/hr
MW = molecular weight of constituent of potential interest, g/mole

These equations were used to calculate bathroom air VOC concentrations derived from VOCs in groundwater, as presented in the accompanying table. The air VOC concentrations were then used to calculate potential inhalation risks for the adult and child resident.

Uncertainties

There are uncertainties associated with the modeling of VOC volatilization from indoor water use for showering. Activity parameters that have uncertainty associated with them include shower durations and time spent in the room after a shower. Uncertain elements related to the modeling include chemical-specific input parameters (e.g., Henry's law constants), flow rate and temperature assumptions, and calculation of mass transfer coefficients. Measurement uncertainty is associated with some input parameters used in the model (e.g., droplet size) as well as the experimental data used to validate the model. Although the main source of VOCs in the air while showering is expected to be the shower spray itself, the conceptualization of the model as falling droplets only may result in an underestimation of modeled indoor concentrations (Foster and Chrostowski, 2003). The model also makes several conservative assumptions such as assuming exposure time equals duration of shower use and not accounting for the actual decrease in concentration

after the water is turned off. Therefore, when all of the exposure and modeling assumptions are combined, it is much more likely that potential risks are significantly overestimated rather than underestimated.

Notes:
ADAF - Age-Dependent Adjustment Factor.
CSF - Cancer Slope Factor.
EPC - Exposure Point Concentration.
IUR - Inhalation Unit Risk Factor.
N/A - Not applicable.
PCBs - Polychlorinated biphenyls.
PFASs = Poly- and Perfluoroalkyl Substances.
PFOA = Perfluorooctanoic Acid.
PFOS - Perfluorooctanesulfonic acid (Perfluorooctane sulfonate).
RfC - Inhalation Reference Concentration.
RfD - Oral Reference Dose.
RME - Reasonable Maximum Exposure.
SVOCs - Semivolatile organic compounds.
USEPA - United States Environmental Protection Agency.
VOCs - Volatile organic compounds.
(1) ADAF is used for chemicals with a mutagenic mode of action for carcinogenesis. The cancer risk is adjusted by multiplying the calculated risk by the ADAF. Not applicable to adult receptors.
(2) Presented on corresponding summary of risk/hazard table.

Total Receptor Risk/Hazard												(2)					(2)

Notes:
ADAF - Age-Dependent Adjustment Factor.
CSF - Cancer Slope Factor.
EPC - Exposure Point Concentration.
IUR - Inhalation Unit Risk Factor.
N/A - Not applicable.
PCBs - Polychlorinated biphenyls.
RfC - Inhalation Reference Concentration.
RfD - Oral Reference Dose.
RME - Reasonable Maximum Exposure.
SVOCs - Semivolatile organic compounds.
VOCs - Volatile organic compounds.
(1) ADAF is used for chemicals with a mutagenic mode of action for carcinogenesis. The cancer risk is adjusted by multiplying the calculated risk by the ADAF. Does not apply to vinyl chloride; addressed based on CSF/IUR. Value for continuous exposure from birth used to evaluate the combined child/adult cancer risk. See Text for explanation.
(2) Presented on corresponding summary of risk/hazard table.

Notes:
ADAF - Age-Dependent Adjustment Factor.
CSF - Cancer Slope Factor.
EPC - Exposure Point Concentration.
IUR - Inhalation Unit Risk Factor.
N/A - Not applicable.
PCBs - Polychlorinated biphenyls.
RfC - Inhalation Reference Concentration.
RfD - Oral Reference Dose.
RME - Reasonable Maximum Exposure.
SVOCs - Semivolatile organic compounds.
VOCs - Volatile organic compounds.
(1) ADAF is used for chemicals with a mutagenic mode of action for carcinogenesis. The cancer risk is adjusted by multiplying the calculated risk by the ADAF. Does not apply to vinyl chloride; addressed based on CSF/IUR.
Value for continuous exposure from birth used to evaluate the combined child/adult cancer risk. See Text for explanation.
(2) Presented on corresponding summary of risk/hazard table.

TABLE 7.3.RME
CALCULATION OF CHEMICAL CANCER RISKS AND NON-CANCER HAZARDS - FUTURE OUTDOOR INDUSTRIAL WORKER (SOIL)
REASONABLE MAXIMUM EXPOSURE
HUMAN HEALTH RISK ASSESSMENT
FIRE TRAINING AREA, NCTAMS LANT DET CUTLER
CUTLER, MAINE

Scenario Timeframe: Future
Receptor Population: Outdoor Industrial Worker
Receptor Age: Adult

							Cancer Risk Calculations						Noncancer Hazard Calculations				
					EPC		Intake/Exposure Concentration		CSF or IUR				Intake/Exposure Concentration		RfD or RfC		
Medium	Exposure Medium	Exposure Point	Exposure Route	Chemical of Potential Concern	Value	Units	Value	Units	Value	Units	ADAF (1)	Cancer Risk	Value	Units	Value	Units	Hazard Quotient

Notes:
ADAF - Age-Dependent Adjustment Factor.
CSF - Cancer Slope Factor.
EPC - Exposure Point Concentration.
IUR - Inhalation Unit Risk Factor.
N/A - Not applicable.
PCBs - Polychlorinated biphenyls.
RfC - Inhalation Reference Concentration.
RfD - Oral Reference Dose.
RME - Reasonable Maximum Exposure.
SVOCs - Semivolatile organic compounds.
VOCs - Volatile organic compounds.
(1) ADAF is used for chemicals with a mutagenic mode of action for carcinogenesis. Not applicable to adult receptors.
(2) Presented on corresponding summary of risk/hazard table.

TABLE 7.4.RME
CALCULATION OF CHEMICAL CANCER RISKS AND NON-CANCER HAZARDS - FUTURE INDOOR INDUSTRIAL WORKER (GROUNDWATER TO INDOOR AIR)
REASONABLE MAXIMUM EXPOSURE
HUMAN HEALTH RISK ASSESSMENT
FIRE TRAINING AREA, NCTAMS LANT DET CUTLER
CUTLER, MAINE

Scenario Timeframe: Future
Receptor Population: Indoor Industrial Worker
Receptor Age: Adult

							Cancer Risk Calculations						Noncancer Hazard Calculations				
					EPC		Intake/Exposure Concentration		CSF or IUR				Intake/Exposure Concentration		RfD or RfC

Groundwater Total												9.57E-08					2.88E-02
Total Receptor Risk/Hazard												**9.57E-08**					**2.88E-02**

Notes:
ADAF - Age-Dependent Adjustment Factor.
CSF - Cancer Slope Factor.
EPC - Exposure Point Concentration.
IUR - Inhalation Unit Risk Factor.
N/A - Not applicable.
RfC - Inhalation Reference Concentration.
RfD - Oral Reference Dose.
RME - Reasonable Maximum Exposure.
SVOCs - Semivolatile organic compounds.
VOCs - Volatile organic compounds.
(1) ADAF is used for chemicals with a mutagenic mode of action for carcinogenesis. The cancer risk is adjusted by multiplying the calculated risk by the ADAF. Does not apply to adult receptors.

Notes:
ADAF - Age-Dependent Adjustment Factor.
CSF - Cancer Slope Factor.
EPC - Exposure Point Concentration.
IUR - Inhalation Unit Risk Factor.
N/A - Not applicable.
PCBs - Polychlorinated biphenyls.
PFASs = Poly- and Perfluoroalkyl Substances.
PFOA = Perfluorooctanoic Acid.
PFOS - Perfluorooctanesulfonic acid (Perfluorooctane sulfonate).
RfC - Inhalation Reference Concentration.
RfD - Oral Reference Dose.
RME - Reasonable Maximum Exposure.
SVOCs - Semivolatile organic compounds.
USEPA - United States Environmental Protection Agency.
VOCs - Volatile organic compounds.
(1) ADAF is used for chemicals with a mutagenic mode of action for carcinogenesis. The cancer risk is adjusted by multiplying the calculated risk by the ADAF. Does not apply to vinyl chloride; addressed based on CSF/IUR.
Value for continuous exposure from birth used to evaluate the combined child/adult cancer risk. See Text for explanation.
(2) Presented on corresponding summary of risk/hazard table.

Notes:
ADAF - Age-Dependent Adjustment Factor.
CSF - Cancer Slope Factor.
EPC - Exposure Point Concentration.
IUR - Inhalation Unit Risk Factor.
N/A - Not applicable.
PCBs - Polychlorinated biphenyls.
PFASs = Poly- and Perfluoroalkyl Substances.
PFOA = Perfluorooctanoic Acid.
PFOS - Perfluorooctanesulfonic acid (Perfluorooctane sulfonate).
RfC - Inhalation Reference Concentration.
RfD - Oral Reference Dose.
RME - Reasonable Maximum Exposure.
SVOCs - Semivolatile organic compounds.
USEPA - United States Environmental Protection Agency.
VOCs - Volatile organic compounds.
(1) ADAF is used for chemicals with a mutagenic mode of action for carcinogenesis. The cancer risk is adjusted by multiplying the calculated risk by the ADAF. Does not apply to vinyl chloride; addressed based on CSF/IUR. Value for continuous exposure from birth used to evaluate the combined child/adult cancer risk. See Text for explanation.
(2) Presented on corresponding summary of risk/hazard table.

Notes:
ADAF - Age-Dependent Adjustment Factor.
CSF - Cancer Slope Factor.
CTE - Central Tendency Estimate.
EPC - Exposure Point Concentration.
IUR - Inhalation Unit Risk Factor.
N/A - Not applicable.
PCBs - Polychlorinated biphenyls.
PFASs = Poly- and Perfluoroalkyl Substances.
PFOA = Perfluorooctanoic Acid.
PFOS - Perfluorooctanesulfonic acid (Perfluorooctane sulfonate).
RfC - Inhalation Reference Concentration.
RfD - Oral Reference Dose.
SVOCs - Semivolatile organic compounds.
USEPA - United States Environmental Protection Agency.
VOCs - Volatile organic compounds.
(1) ADAF is used for chemicals with a mutagenic mode of action for carcinogenesis. The cancer risk is adjusted by multiplying the calculated risk by the ADAF. Not applicable to adult receptors.
(2) Assumes incidental ingestion of groundwater is trivial.
(3) Presented on corresponding summary of risk/hazard table.

Total Receptor Risk/Hazard												(2)					(2)

Notes:
ADAF - Age-Dependent Adjustment Factor.
CSF - Cancer Slope Factor.
EPC - Exposure Point Concentration.
IUR - Inhalation Unit Risk Factor.
N/A - Not applicable.
PCBs - Polychlorinated biphenyls.
RfC - Inhalation Reference Concentration.
RfD - Oral Reference Dose.
RME - Reasonable Maximum Exposure.
SVOCs - Semivolatile organic compounds.
VOCs - Volatile organic compounds.
(1) ADAF is used for chemicals with a mutagenic mode of action for carcinogenesis. The cancer risk is adjusted by multiplying the calculated risk by the ADAF. Does not apply to vinyl chloride; addressed based on CSF/IUR.
Value for continuous exposure from birth used to evaluate the combined child/adult cancer risk. See Text for explanation.
(2) Presented on corresponding summary of risk/hazard table.

Notes:
ADAF - Age-Dependent Adjustment Factor.
CSF - Cancer Slope Factor.
EPC - Exposure Point Concentration.
IUR - Inhalation Unit Risk Factor.
N/A - Not applicable.
PCBs - Polychlorinated biphenyls.
RfC - Inhalation Reference Concentration.
RfD - Oral Reference Dose.
RME - Reasonable Maximum Exposure.
SVOCs - Semivolatile organic compounds.
VOCs - Volatile organic compounds.
(1) ADAF is used for chemicals with a mutagenic mode of action for carcinogenesis. The cancer risk is adjusted by multiplying the calculated risk by the ADAF. Does not apply to vinyl chloride; addressed based on CSF/IUR.
Value for continuous exposure from birth used to evaluate the combined child/adult cancer risk. See Text for explanation.
(2) Presented on corresponding summary of risk/hazard table.

TABLE 7.3.CTE
CALCULATION OF CHEMICAL CANCER RISKS AND NON-CANCER HAZARDS - FUTURE OUTDOOR INDUSTRIAL WORKER (SOIL)
CENTRAL TENDENCY ESTIMATE
HUMAN HEALTH RISK ASSESSMENT
FIRE TRAINING AREA, NCTAMS LANT DET CUTLER
CUTLER, MAINE

Scenario Timeframe: Future
Receptor Population: Outdoor Industrial Worker
Receptor Age: Adult

							Cancer Risk Calculations						Noncancer Hazard Calculations				
					EPC		Intake/Exposure Concentration		CSF or IUR				Intake/Exposure Concentration		RfD or RfC		
Medium	Exposure Medium	Exposure Point	Exposure Route	Chemical of Potential Concern	Value	Units	Value	Units	Value	Units	ADAF (1)	Cancer Risk	Value	Units	Value	Units	Hazard Quotient

Notes:
ADAF - Age-Dependent Adjustment Factor.
CSF - Cancer Slope Factor.
CTE - Central Tendency Estimate.
EPC - Exposure Point Concentration.
IUR - Inhalation Unit Risk Factor.
N/A - Not applicable.
PCBs - Polychlorinated biphenyls.
RfC - Inhalation Reference Concentration.
RfD - Oral Reference Dose.
SVOCs - Semivolatile organic compounds.
VOCs - Volatile organic compounds.
(1) ADAF is used for chemicals with a mutagenic mode of action for carcinogenesis. Not applicable to adult receptors.
(2) Presented on corresponding summary of risk/hazard table.

TABLE 7.4.CTE
CALCULATION OF CHEMICAL CANCER RISKS AND NON-CANCER HAZARDS - FUTURE INDOOR INDUSTRIAL WORKER (GROUNDWATER TO INDOOR AIR)
CENTRAL TENDENCY ESTIMATE
HUMAN HEALTH RISK ASSESSMENT
FIRE TRAINING AREA, NCTAMS LANT DET CUTLER
CUTLER, MAINE

Scenario Timeframe: Future
Receptor Population: Indoor Industrial Worker
Receptor Age: Adult

			Exp. Route Total									4.79E-08					1.44E-02
Groundwater Total												4.79E-08					1.44E-02
Total Receptor Risk/Hazard												**4.79E-08**					**1.44E-02**

Notes:
ADAF - Age-Dependent Adjustment Factor.
CSF - Cancer Slope Factor.
CTE - Central Tendency Estimate.
EPC - Exposure Point Concentration.
IUR - Inhalation Unit Risk Factor.
N/A - Not applicable.
RfC - Inhalation Reference Concentration.
RfD - Oral Reference Dose.
SVOCs - Semivolatile organic compounds.
VOCs - Volatile organic compounds.
(1) ADAF is used for chemicals with a mutagenic mode of action for carcinogenesis. The cancer risk is adjusted by multiplying the calculated risk by the ADAF. Does not apply to adult receptors.

N/A - Not applicable.
PCBs - Polychlorinated biphenyls.
PFASs = Poly- and Perfluoroalkyl Substances.
PFOA = Perfluorooctanoic Acid.
PFOS - Perfluorooctanesulfonic acid (Perfluorooctane sulfonate).
RfC - Inhalation Reference Concentration.
RfD - Oral Reference Dose.
SVOCs - Semivolatile organic compounds.
USEPA - United States Environmental Protection Agency.
VOCs - Volatile organic compounds.
(1) ADAF is used for chemicals with a mutagenic mode of action for carcinogenesis. The cancer risk is adjusted by multiplying the calculated risk by the ADAF. Does not apply to vinyl chloride; addressed based on CSF/IUR.
Value for continuous exposure from birth used to evaluate the combined child/adult cancer risk. See Text for explanation.
(2) Presented on corresponding summary of risk/hazard table.

Notes:
ADAF - Age-Dependent Adjustment Factor.
CSF - Cancer Slope Factor.
CTE - Central Tendency Estimate.
EPC - Exposure Point Concentration.
IUR - Inhalation Unit Risk Factor.
N/A - Not applicable.
PCBs - Polychlorinated biphenyls.
PFASs = Poly- and Perfluoroalkyl Substances.
PFOA = Perfluorooctanoic Acid.
PFOS - Perfluorooctanesulfonic acid (Perfluorooctane sulfonate).
RfC - Inhalation Reference Concentration.
RfD - Oral Reference Dose.
SVOCs - Semivolatile organic compounds.
USEPA - United States Environmental Protection Agency.
VOCs - Volatile organic compounds.
(1) ADAF is used for chemicals with a mutagenic mode of action for carcinogenesis. The cancer risk is adjusted by multiplying the calculated risk by the ADAF. Does not apply to vinyl chloride; addressed based on CSF/IUR. Value for continuous exposure from birth used to evaluate the combined child/adult cancer risk. See Text for explanation.
(2) Presented on corresponding summary of risk/hazard table.

				Ingestion	Inhalation	Dermal	Exposure Routes Total	Primary Target Organ	Ingestion	Inhalation	Dermal	Exposure Routes Total

PCBs - Polychlorinated biphenyls.

PFASs = Poly- and Perfluoroalkyl Substances.

PFOA = Perfluorooctanoic Acid.

PFOS - Perfluorooctanesulfonic acid (Perfluorooctane sulfonate).

RME - Reasonable Maximum Exposure.

SVOCs - Semivolatile organic compounds.

USEPA - United States Environmental Protection Agency.

VOCs - Volatile organic compounds.

(a) Totals calculated assuming potential receptors contact surface soil within the associated exposure point/area, groundwater, and sediment and surface water within the wetland.

(b) Totals calculated assuming potential receptors contact subsurface soil within the associated exposure point/area, groundwater, and sediment and surface water within the wetland.

SUMMARY OF RECEPTOR RISKS AND HAZARDS FOR COPCs - CURRENT/FUTURE RECREATIONAL USER - ADULT AND CHILD (SOIL, WETLAND SURFACE WATER, AND WETLAND SEDIMENT)

REASONABLE MAXIMUM EXPOSURE

HUMAN HEALTH RISK ASSESSMENT

FIRE TRAINING AREA, NCTAMS LANT DET CUTLER

CUTLER, MAINE

Scenario Timeframe: Current/Future
Receptor Population: Recreational
Receptor Age: Adult and Child

Medium	Exposure Medium	Exposure Point	Chemical of Potential Concern	Carcinogenic Risk Young Child + Adult				Non-Carcinogenic Hazard Quotient Young Child				
				Ingestion	Inhalation	Dermal	Exposure Routes Total	Primary Target Organ	Ingestion	Inhalation	Dermal	Exposure Routes Total

Notes:

COPC - Chemical of potential concern.

HI - Hazard Index.

N/A - Not applicable.

PCBs - Polychlorinated biphenyls.

RME - Reasonable Maximum Exposure.

SVOCs - Semivolatile organic compounds.

VOCs - Volatile organic compounds.

(a) Totals calculated assuming potential receptors contact surface soil within the associated exposure point/area and sediment and surface water within the wetland.

(b) Totals calculated assuming potential receptors contact subsurface soil within the associated exposure point/area and sediment and surface water within the wetland.

TABLE 9.3.RME

SUMMARY OF RECEPTOR RISKS AND HAZARDS FOR COPCs - FUTURE OUTDOOR INDUSTRIAL WORKER (SOIL)

REASONABLE MAXIMUM EXPOSURE

HUMAN HEALTH RISK ASSESSMENT

FIRE TRAINING AREA, NCTAMS LANT DET CUTLER

CUTLER, MAINE

Scenario Timeframe: Future
Receptor Population: Outdoor Industrial Worker
Receptor Age: Adult

Medium	Exposure Medium	Exposure Point	Chemical of Potential Concern	Carcinogenic Risk Adult				Non-Carcinogenic Hazard Quotient Adult				
				Ingestion	Inhalation	Dermal	Exposure Routes Total	Primary Target Organ	Ingestion	Inhalation	Dermal	Exposure Routes Total

Notes:

COPC - Chemical of potential concern.

HI - Hazard Index.

N/A - Not applicable.

PCBs - Polychlorinated biphenyls.

RME - Reasonable Maximum Exposure.

SVOCs - Semivolatile organic compounds.

VOCs - Volatile organic compounds.

(a) Totals calculated assuming potential receptors contact surface soil within the associated exposure point/area.

(b) Totals calculated assuming potential receptors contact subsurface soil within the associated exposure point/area.

				Ingestion	Inhalation	Dermal	Exposure Routes Total	Primary Target Organ	Ingestion	Inhalation	Dermal	Exposure Routes Total

Notes:

COPC - Chemical of potential concern.

EPHs - Extractable petroleum hydrocarbons.

HI - Hazard Index.

N/A - Not applicable.

PCBs - Polychlorinated biphenyls.

PFASs = Poly- and Perfluoroalkyl Substances.

PFOA = Perfluorooctanoic Acid.

PFOS - Perfluorooctanesulfonic acid (Perfluorooctane sulfonate).

RME - Reasonable Maximum Exposure.

SVOCs - Semivolatile organic compounds.

USEPA - United States Environmental Protection Agency.

VOCs - Volatile organic compounds.

(a) Totals calculated assuming potential receptors contact surface soil within the associated exposure point/area and sediment and surface water within the wetland.

(b) Totals calculated assuming potential receptors contact subsurface soil within the associated exposure point/area and sediment and surface water within the wetland.

Notes:
ND - Not Detected. See Attachment A for data tables.
RL - Reporting Limit.
U - Not Detected at Specified Reporting Limit.
ND = RL Data Treatment - Total PCBs were calculated per sample by summing the individual Aroclor concentrations for detected results and the full reporting detection limit for non-detect results. For samples without any detections of individual Aroclors, the maximum reporting detection limit within the sample is presented as a non-detect value. This value is considered in the uncertainty section of the risk assessment.

ND = 0 Data Treatment - Total PCBs were calculated per sample by summing only the detected individual Aroclor concentrations. For samples without any detections of individual Aroclors, the maximum reporting detection limit within the sample is presented as a non-detect value. This approach was used in the risk assessment.

1.0 INTRODUCTION

This appendix presents an ecological risk assessment (ERA) conducted for the former Fire Training Area (FTA) located at the Naval Computer and Telecommunications Area Master Station Atlantic Detachment (NCTAMS LANT Det) in Cutler, Maine (Cutler) (**Figure 1**). This ERA addresses the potential for ecological risks associated with the historical use of the area.

The former FTA (Site 1) consists of a former gravel pit that was used by the Navy for firefighting training exercises from the early 1960s to the 1980s and a drum disposal area (DDA; Site 5) located on the southern edge of the former FTA, which was combined with the former FTA into a single site (Site 1) in 2012. Since the DDA was physically located within the boundaries of the former FTA, they were combined in 2012 and all environmental issues are being addressed as site 1. The chemicals associated with these activities, and therefore potentially present at the site, include volatile organic compounds (VOCs), polycyclic aromatic hydrocarbons (PAHs), polychlorinated biphenyls (PCBs), petroleum hydrocarbons, and metals. The site history and a site description are presented in detail in the Remedial Investigation (RI) report text.

1.1 Objectives

The primary objective of this ERA for the site is to evaluate whether chemicals of potential concern (COPCs) attributable to past operations have the potential to cause unacceptable adverse risk to ecological receptors. The specific objectives of the ERA are as follows:

- Determine whether any complete exposure pathways associated with surface water, sediment, or soil exist at the former FTA.
- For areas with complete exposure pathways, compare the concentrations of chemicals detected in surface soil and sediment to ecological risk-based screening criteria to determine the site COPCs for further evaluation.
- Evaluate chemicals found to exceed screening criteria for potential to cause unacceptable adverse risk to ecological receptors.

This ERA focuses on surface soil, surface water, and sediment exposure pathways. Chemicals in surface soil may be contacted directly by plants and invertebrates living in the soil. Chemicals in sediment and surface water may be contacted directly by aquatic or benthic invertebrates living in the wetland. Wildlife foraging within the former FTA could also be exposed directly to chemicals in soil, surface water, and sediment through incidental ingestion of soil, surface water, and sediment and indirectly by ingestion of contaminated prey items living at the site.

1.2 Approach for the ERA

This ERA was conducted in accordance with the *Navy Policy for Conducting Ecological Risk Assessments* and *Navy Guidance for Conducting Ecological Risk Assessments* (DON 1999a; 1999b).

This approach is consistent with the eight-step tiered approach to ERAs presented in the *Ecological Risk Assessment Guidance for Superfund: Process for Designing and Conducting Ecological Risk Assessments, Interim Final* (USEPA 1997). Additional guidance documentation includes, but is not limited to, the following:

- Department of the Navy Environmental Restoration Program Manual (DON 2006)
- Navy Policy on the Use of Background Chemical Levels (DON 2004)
- Navy Policy on Sediment Site Investigation and Response Action (DON 2002)
- Guidelines for Ecological Risk Assessment (USEPA 1998)
- The Role of Screening-Level Risk Assessments and Refining Contaminants of Concern in Baseline Ecological Risk Assessments (USEPA 2001a)

As described in Navy guidance (DON 1999a; 1999b), a three-tiered approach that incorporates different levels of assessment complexity is used to evaluate the potential for ecological risk. The tiered approach may be implemented in its entirety depending on the level and magnitude of risk that is determined in prior tiers. This approach consists of the following tiers:

- Tier 1 – Ecological Screening Risk Assessment (SRA)
- Tier 2 – Baseline Ecological Risk Assessment (BERA)
- Tier 3 – Risk Evaluation of Remedial Alternatives

The approach for the ERA follows the approach used recently for the Very Low Frequency (VLF) Peninsula and Salvage Yard Area (SYA) ERAs (Resolution 2016a,b). An ERA Work Plan was not generated for the former FTA, but the 2012 Tier II Sampling and Analysis Plan (SAP) for the former FTA (Tetra Tech 2012) identified ecological screening levels and relevant exposure pathways that were similar to those considered at the SYA; both areas included terrestrial and wetland habitats.

This ERA has been structured according to United States (U.S.) Navy policy (DON 1999a; 1999b) to fulfill both the requirements of an eight-step U.S. Environmental Protection Agency (USEPA) ERA (USEPA 1997) and a U.S. Navy ERA. **Section 3.0** of this document presents the Tier 1 ecological SRA and **Section 4.0** presents the first step of the Tier 2 BERA. Tier 3 will be presented separately, if warranted.

2.0 DATA EVALUATION

The purpose of **Section 2.0** is to summarize the environmental data available for use for each of the media quantitatively evaluated in the ERA. In addition, **Section 2.0** summarizes the methodology used to determine exposure point concentrations (EPCs) for COPCs in each medium.

Environmental data used in this ERA include surface soil and freshwater surface water and sediment collected between 2006 and 2016. A detailed discussion of the sampling can be found in the RI report (Resolution 2017).

2.1 Data Used in the ERA

The following sections summarize the environmental data available for each of the media quantitatively evaluated in this ERA. **Attachment A** includes tables summarizing the samples by media and identifying the analyses performed for each sample considered in the ERA. Individual analytical results for samples used in this ERA are also included in **Attachment A**. Summary statistics are included in **Attachment B** and data treatment for these statistics is summarized in **Section 2.2**. Samples were analyzed for a variety of parameters including PCBs, metals, pesticides, total petroleum hydrocarbons (TPH), VOCs, and semivolatile organic compounds (SVOCs).

TPH data for diesel range organics, gasoline range organics, and hydrocarbon ranges were not evaluated in the ERA due to a lack of relevant screening levels. Impacts due to petroleum products are assessed using the relevant VOC (i.e., benzene, toluene, ethylbenzene, xylene) and PAH data.

2.1.1 Soil

Surface soil samples (**Figure 2** and **Figure 3**) were collected from the top 0 to 2 feet (ft) below ground surface (bgs) during multiple sampling events conducted between 2007 and 2016. Samples were analyzed for inorganics, PCBs, pesticides, SVOCs, VOCs, and TPH. Surface soil samples collected in November 2016 were analyzed for both total and hexavalent chromium. With the exception of the petroleum hydrocarbon data, all data were considered in the ERA. Samples identified as removed during excavations were not included in the ERA.

2.1.2 Surface Water

Surface water samples (**Figure 2**) were collected from the wetland in 2006 and 2012. Samples were analyzed for total and dissolved phase inorganics, PCBs, SVOCs, VOCs, and TPH. With the exception of the petroleum hydrocarbon data, all data were considered in the ERA.

2.1.3 Sediment

Sediment samples (**Figure 2**) were collected from the wetland area in November 2012, June 2014, and November 2016 (one sample) from a depth of 0 to 0.5 ft bgs. Samples were analyzed for inorganics, PCBs, pesticides, SVOCs, VOCs, and TPH. The sediment sample collected in November

2016 (FTA-SED-07) was analyzed for total and hexavalent chromium. With the exception of the petroleum hydrocarbon data, all data were considered in the ERA.

2.1.4 Groundwater

Ecological receptors are not exposed to groundwater. The pathway to this medium is not complete and was not evaluated in the ecological evaluation.

2.2 Available Background Data

Three freshwater sediment samples collected as part of the SYA RI effort in 2009 are also considered to be background samples for the freshwater sediments of the former FTA. The *Background Study for Remedial Investigations for Installation Restoration Sites at NCTAMS LANT Det in Cutler, Maine* (Battelle 2005) described the collection of background surface soil samples (0–1 ft bgs). Samples collected from 15 locations in each of the two primary soil types (glacial till and glacio-marine sediments) were considered to be applicable to the former FTA. The data associated with these samples are included in Appendix A of the RI report.

While it is assumed that chemicals within background levels are not attributed to Navy activities, background levels have not been utilized for screening purposes but are considered in the Tier 2 BERA. Appendix C of the RI report includes the background evaluation considered in the BERA.

2.3 Data Treatment

Analytical data were evaluated, validated and qualified prior to use in the risk assessment. Data evaluation and validation included a comparison of the site data to corresponding blank (laboratory, field, equipment, and trip) concentration data. Data rejected by the evaluation ("R" qualified) were not used. Estimated values (e.g., "J" qualified) were used in the risk assessment without modification. If the value was flagged with "U" or "UJ", the result was considered a non-detected (an undetected) value.

For each exposure area and medium, the data were compiled into summary statistics as discussed in the following paragraphs. For each chemical detected at least once within an area/media, the summary statistics include frequency of detection (FOD), range of detection limits, range of detected concentrations, mean of detected concentrations, and location of maximum detected result. The following guidance documents were used to develop the summary statistics:

- Navy Human Health Risk Assessment Guidance (DON 2008)
- Risk Assessment Guidance for Superfund: Volume I – Human Health Evaluation Manual, Parts A and D (USEPA 1989; 2001b)
- Navy Guidance for Conducting Ecological Risk Assessments (DON 1999a,b)

Treatment of Duplicates: For sample locations in which a duplicate sample was also collected, the duplicate sample results for each chemical/medium/area combination were processed for use in the calculation of summary statistics. Duplicates were resolved as follows: (1) where both the sample and the duplicate are not detected, the resulting values is the average of the limits of detection (LODs); (2) where both the sample and the duplicate are detected, the resulting values is the average of the detected results; and (3) where one of the pair is reported as not detected and the other is detected, the detected concentration is used.

Frequency of Detection: The detection frequency is reported as the number of detected samples out of the total number of samples analyzed for a specific chemical, after resolution of duplicates as described above. The number of samples that will be used to calculate the detection frequency reflects the treatment of non-detects described above.

Minimum Detected Concentration or Minimum Reporting Limit: This is the minimum detected concentration or the minimum detection limit (for analytes not detected) for each chemical/medium/depth interval/area combination, after resolution of duplicates as described above.

Maximum Detected Concentration or Maximum Reporting Limit: This is the maximum detected concentration or the maximum detection limit (for analytes not detected) for each chemical/medium/depth interval/area combination, after resolution of duplicates as described above.

Mean of Detected Concentrations: This is the average of the detected concentrations for each chemical/medium/depth interval/area combination, after resolution of duplicates as described above.

Location of Maximum Detected Concentration: This is the sample location associated with the maximum detected concentration, as defined above, for each chemical/medium/depth interval/area combination.

In addition to individual chemicals, summary statistics were calculated for Total Xylenes, Total PCBs (as Aroclors), and Total PAHs (including totals for both high and low molecular weight [LMW] PAHs) as follows:

- For samples with at least one detect, only the detected results were summed to calculate the total concentration.
- Where a sample does not have any detections of individual chemicals, then the total concentration was considered a non-detect with a LOD equal to the maximum LOD of the individual chemicals.

Summary statistics for samples considered in the ERA are included in **Attachment B**. For each medium, the summary tables provide the FOD, range of detection limits, range of detected concentrations, mean of detected concentrations, and location of maximum detected result for each detected chemical.

3.0 TIER 1 ECOLOGICAL SCREENING RISK ASSESSMENT

The primary objective of a Tier 1 ecological SRA is to determine which, if any, exposure pathways and COPCs warrant further evaluation in a more refined ERA. The Navy Tier 1 ecological SRA process can be described in two steps. Step 1 is equivalent to Step 1 of the USEPA (1997) ERA process and includes a site description, pathway identification/problem formulation, and toxicity evaluation. The goals of this step are to describe the ecological setting of the site and determine whether ecological exposure pathways are potentially complete. Step 2 of the Navy Tier 1 ecological SRA process is equivalent to Step 2 of the USEPA (1997) ERA process. First, potential exposure is evaluated based on conservative assumptions. Then, risk is estimated by comparing the chemical concentrations detected in each medium of concern to conservative, screening-level, medium-specific benchmark criteria.

After Step 2 in the risk assessment process, a Scientific/Management Decision Point (SMDP) is normally reached to determine whether exit criteria for Tier 1, Step 2 have been met. The potential outcomes of the SMDP are as follows:

- The site passes the ecological SRA based on an absence of complete exposure pathways and/or an absence of unacceptable risks (i.e., all maximum concentrations less than benchmarks). Under these conditions, the decision is made that the site poses no unacceptable risks to ecological resources, further ERA or site remediation is unwarranted, and the site may be closed out for ecological concerns.
- The site fails the ecological SRA on the basis that complete pathways and potential unacceptable risks are indicated for at least one chemical. Under these conditions, the decision is made to either initiate interim cleanup or proceed to Tier 2 of the ERA process. The Tier 1 process also identifies those chemicals that should be retained for further consideration and those chemicals that can be eliminated from the risk assessment.

The Tier 1 ecological SRA is being submitted with the draft RI report for regulatory review. A preliminary Tier 2, Step 3a BERA has been prepared based on the results of the Tier 1 ecological SRA to further assess the potential for adverse effects to ecological receptors at the former FTA. If necessary, a SMDP conference with the regulatory and Navy risk managers will be scheduled to discuss the Tier 1 results. The Preliminary Tier 2 assessment will be revised in response to regulatory comments.

3.1 Step 1 – Screening-Level Problem Formulation

Step 1 is divided into several sections that help define the problem at the screening level. Site history details and ecological setting characteristics specifically relevant to this ecological SRA are provided in **Section 3.1.1**. Assessment and measurement endpoints selected for this ecological SRA are presented in **Section 3.1.2**. The selection of representative species for the ecological SRA

is described in **Section 3.1.3**. Exposure pathways are presented in **Section 3.1.4** and their incorporation into the conceptual site model (CSM) is described in **Section 3.1.5**. **Section 3.1.6** provides a description of the toxicity evaluation and **Section 3.1.7** discusses the selection of COPC.

3.1.1 Ecological Setting

The NCTAMS LANT Det Cutler facility, situated on a 2,800-acre peninsula on the coast of eastern Maine (**Figure 1**), was established on June 23, 1961. The former FTA is located in the northern portion of the NCTAMS LANT, to the north of the VLF Peninsula, east of Holmes Bay and Machias Bay, and west of Little Machias Bay. Undeveloped forested land and several freshwater wetlands (known locally as heaths) surround the former FTA. The site was historically used for firefighting operations and disposal of fuel oil.

In 2004, Tetra Tech performed a remedial action in the heath wetland north of the former FTA. Previous investigations had indicated that the area had been impacted by petroleum-contaminated soils. This area, referred to as the Sand Wedge, was excavated and the wetlands restored (**Figure 4**). After the soil was removed, the wetland was restored through placing a layer of organic enriched soil, seeding with a wetland mix, and planting native saplings and other plants in the wetlands.

Additional removal actions were conducted in the center of the former FTA between 2006 and 2009 and a wetland was developed during restoration activities. During the 2009 soil removal action at the former FTA, an area of lower elevation in the central portion of the site was created to enhance the wetland restoration area to the north and to provide additional habitats for wildlife. The elevation in the central portion of the former FTA was reduced during the creation of the freshwater wetland, producing shallow groundwater levels at or near the ground surface. Currently, the majority of runoff drains into the created wetland in the central portion of the site (**Figure 4**).

Standing water may be seasonally present within the wetlands; however, fish are not expected to be present. Maximum water depths during the 2014 wetland sampling effort were approximately 6 inches with no standing water present at some locations. The Sand Wedge and the created wetland account for approximately 3.3 acres of wetlands within the site.

The rest of the site (approximately 7 acres) is primarily composed of cleared, open areas with a forested area around the perimeter. The DDA is located in the southwest corner of the former FTA immediately to the south of the removal area/created wetland and directly upgradient of the wetland, based on previous determinations of groundwater flow. Previous removal actions have removed over 30 drums and drum remnants from the DDA. The DDA is currently a cleared open area adjacent to a forested area located to the south.

3.1.2 Assessment Endpoints and Measures of Effect

Assessment endpoints describe the characteristics of an ecosystem that has an intrinsic environmental value to be protected (e.g., protection of avian community). Typically, assessment endpoints and receptors are selected for their potential exposure, ecological significance, economic importance, and/or societal relevance. Because the ecological SRA represents a very conservative screening level assessment, the assessment endpoints are stated in generic terms. Assessment endpoints are critical to problem formulation, because they link the risk assessment to management concerns and are central to refining the CSM (USEPA 1997).

Because assessment endpoints often cannot be measured directly, measures of effect are a set of surrogate endpoints used to provide a quantitative metric for evaluating potential effects of chemicals on the ecosystem components potentially at risk. Measures of effect provide the actual measurements used to evaluate ecological risk and are selected to represent mechanisms of toxicity and exposure pathways.

Ecological receptors are defined as plant and animal populations, communities, habitats, or sensitive environments. The following assessment endpoints and their associated measures of effect were considered for the former FTA.

Assessment Endpoint	**Measures of Effect**
Protection and maintenance of indigenous soil invertebrate communities in upland habitat areas at levels similar to those of nearby populations not exposed to site-related chemicals.	Comparison of onsite concentrations of chemicals in surface soil to soil screening values derived for the protection of soil invertebrates.
Protection and maintenance of indigenous terrestrial plant communities in upland habitat areas at levels similar to those of nearby populations not exposed to site-related chemicals.	Comparison of onsite concentrations of chemicals in surface soil to soil screening values derived for the protection of plants.
Protection and maintenance of aquatic communities in freshwater habitat areas at levels similar to those of nearby populations not exposed to site-related chemicals.	Comparison of onsite wetland surface water concentrations to surface water screening values.
Protection and maintenance of benthic invertebrate communities in freshwater habitat areas at levels similar to those of nearby populations not exposed to site-related chemicals.	Comparison of onsite wetland sediment concentrations to sediment screening values.
Protection and maintenance of herbivorous wildlife receptors within upland habitat areas at levels similar to those of nearby populations not exposed to site-related chemicals.	Comparison of calculated TDD for avian and mammalian receptors from exposure to chemicals in surface soil and ingestion of contaminated plants to chemical-specific TRVs.

Assessment Endpoint	Measures of Effect
Protection and maintenance of insectivorous wildlife receptors within upland habitat areas at levels similar to those of nearby populations not exposed to site-related chemicals.	Comparison of calculated TDD for avian and mammalian receptors from exposure to chemicals in surface soil and ingestion of contaminated earthworms to chemical-specific TRVs.
Protection and maintenance of insectivorous wildlife receptors within wetland habitat areas at levels similar to those of nearby populations not exposed to site-related chemicals.	Comparison of calculated TDD for avian and mammalian receptors from exposure to chemicals in wetland sediment and ingestion of contaminated invertebrates to chemical-specific TRVs.

TDD total daily dose
TRV toxicity reference value

Screening on the basis of toxicity due to direct exposure in the ecological SRA was done by comparing the maximum detected site concentrations against appropriate risk-based screening levels. The risk-based screening levels used to select COPCs for lower trophic level receptors are discussed in **Section 3.1.7**.

Food web models were used to assess risks to mammals and birds due to bioaccumulation. Bioaccumulation-based measures of effects corresponding to the survival, growth, and reproductive assessment endpoints for indirect exposure of wildlife (i.e., birds and mammals) were identified for the representative species or their surrogates and are discussed in **Section 3.2.1**. The expected exposure of the representative species was modeled from measured COPC concentrations in site media to estimate the measurement endpoint (ingestion/uptake) in the representative species. The expected exposure was compared to the toxicity reference values (TRVs) to estimate the likelihood of adverse effects.

3.1.3 Selection of Representative Wildlife Species

Many receptors in the soil and surface water environments at the site are adequately described in general categories such as soil invertebrates, benthic invertebrates, vegetation, and aquatic invertebrates. This is due to the nature of the threshold values, effects values, or criteria that are typically used to characterize risk for such organisms. For vertebrate receptors, selection of a particular species is required so that intake through eating and drinking can be estimated. The selected receptors are either present at the site or similar to receptors that are present at the site.

As described in **Section 3.1.1**, the areas under evaluation for the food web model are the upland portion of the site, including cleared open areas surrounded by forest with wetland habitat in the northern and central portions of the site. Selection of representative receptors for the ecological SRA was determined based on site-specific information (i.e., site presence/observations, local/regional occurrence records, and/or likelihood of site presence) and relevant exposure pathways. The primary weight in selection of representative species was placed on selection of receptors that represent key feeding guilds and ecological communities known and/or expected to

be present at the site, and for which adequate life history data are available (e.g., per USEPA 1993).

Receptors were selected to represent species with limited home ranges (e.g., short-tailed shrew) that would be expected to make extensive use of the site. Since chemicals may bioaccumulate through the food web, representative vertebrate wildlife species from two trophic levels were selected for evaluation. These trophic levels include Trophic Level 2 (TL2) herbivores and Trophic Level 3 (TL3) insectivores. Herbivores (TL2) are primary consumers, ingesting primary producers (vegetation) and analytes from one trophic level. Insectivores (TL3) consume primary consumers (invertebrates).

Trophic Level 4 (TL4) carnivorous birds and mammals were not selected for evaluation in the ERA because their home ranges (hundreds of acres) are much larger than the site (approximately 10.3 acres with approximately 3.3 acres of wetlands), so they would only consume a small portion of their food from the site. Therefore, risks would be greater to small mammals and birds that obtain all of their food from the site.

The following representative birds and mammals were selected for evaluation in the food web model:

- Herbivorous mammal – meadow vole
- Herbivorous bird – bobwhite quail
- Insectivorous mammals – short-tailed shrew (terrestrial area) and raccoon (wetland habitat)
- Insectivorous birds – American robin (terrestrial area) and marsh wren (wetland habitat)

These receptors are consistent with those used recently for the ERA at the SYA, which also contains terrestrial and wetland habitats.

3.1.4 Exposure Pathway Analysis

Exposure pathways vary in importance depending on the species and site. In general, chemicals released from materials dumped in terrestrial areas can initially contaminate surface soils. Natural precipitation can then cause the chemical contaminants to leach downward into subsurface soils and groundwater. Discharge of the groundwater can result in the contamination of surface water and sediment inhabited by aquatic receptors. Erosion of the surface soil was possible at this site and eroded soil may have deposited into the wetland portions of the site. Therefore, it is anticipated that ecological receptors may come in contact with surface soil, surface water, and surface sediment within the former FTA.

The following exposure pathways were evaluated for the former FTA:

- Soil invertebrates and plants directly exposed to site-related compounds in surface soil.
- Benthic invertebrates directly exposed to site-related compounds in freshwater surface sediment.
- Aquatic invertebrates directly exposed to site-related compounds in freshwater surface water.
- Birds and mammals (i.e., meadow vole, bobwhite quail, short-tailed shrew, American robin) exposed to site-related compounds through incidental ingestion of surface soil and by ingestion of contaminated prey items impacted by surface soil.
- Birds and mammals (i.e., marsh wren, raccoon) exposed to site-related compounds through incidental ingestion of sediment, ingestion of surface water as drinking water, and by ingestion of contaminated prey items impacted by surface sediment and surface water.

Although reptiles are likely to be present in the wetland area, they were not selected for evaluation because of the general lack of toxicity information and the lack of methods to evaluate their exposure to chemicals. Aquatic and semi-aquatic plants were also not selected for evaluation because there is limited toxicity data to evaluate potential risks to these receptors. These exposure pathways are consistent with those evaluated at the SYA (Resolution 2016b).

3.1.5 Development of Ecological Conceptual Site Model

An ecological CSM was developed to provide a clear and concise description of how ecological receptors may come into contact with site-related COPCs via release mechanisms and exposure to soil and/or sediment. The ecological CSM provides a schematic representation of the potential site-related COPC release mechanisms, the exposure pathways, and potential ecological communities or wildlife receptors to be assessed. **Figure 5** presents an ecological CSM figure for the site identifying potential source areas, migration pathways, and potentially exposed ecological receptors.

At the former FTA, the source of the chemicals includes fire-training activities and disposal of waste fuel oil and drum disposal within the DDA. Therefore, the immediate exposure medium is the surface soil. Terrestrial plants, invertebrates, and vertebrates are exposed to the surface soil by direct contact and/or ingestion of soil and other food items. Chemicals can also infiltrate into the groundwater, which is then released to the surface water where chemicals can contaminate wetland sediment. Overland runoff or erosion leads to contamination of the wetland surface water and sediment as well. Aquatic and semi-aquatic vegetation, benthic invertebrates, and vertebrates are exposed to the surface water and sediment by direct contact and/or ingestion of sediment, surface water, and other food items. Terrestrial vertebrates may be exposed to chemicals found in

the air via inhalation. Although this pathway is possible, it is not a significant pathway and will not be evaluated in this ERA.

3.1.6 Toxicity Evaluation

The toxicity evaluation consists of identification of screening ecological values (SEVs) for surface soil and sediment, and TRVs for the food web pathways. These values are expressed as concentrations (in milligram per kilogram [mg/kg] on a dry weight [dw] basis for soil and sediment; in micrograms per liter for surface water) or dosage (in mg/kg of body weight per day [mg/kg-day] for wildlife) of a chemical believed to have little or no effect on the long-term health of the representative species of concern. **Attachment D** includes the SEVs for soil and sediment as well as the TRVs for wildlife.

Soil Screening Levels

For the surface soil data sets, the maximum detected concentration of each chemical was compared to media-specific SEVs to assess the potential for risks to the plant and soil invertebrate communities. Chemicals detected above these SEVs were identified as COPCs for further evaluation in the Tier 2 BERA. To be consistent among recent ERAs completed at the NCTAMS LANT Det Cutler facility, the selection of SEVs deviated somewhat from what was presented in the 2012 SAP (Tetra Tech 2012). Soil SEVs were selected, when available, from the following hierarchy of sources:

- USEPA Ecological Soil Screening Levels (Eco-SSLs) for plants and soil invertebrates derived according to USEPA guidance (2005).
- Canadian Council of Ministers of the Environment (CCME) Soil Quality Guidelines for environmental health (2002; 2015).
- Plant- and invertebrate-based soil screening benchmarks developed by the Oak Ridge National Laboratory (ORNL) (Efroymson et al. 1997; Efroymson, Will, and Suter 1997).
- Dutch Target Values (Buchman 2008) were also considered for organic chemicals.

Soil SEVs from alternate sources (e.g., USEPA 2003; 2015) were considered when values were not available from the sources listed above. Because a terrestrial food web model was completed as part of the ecological SRA, comparison of soil data to SEVs for the protection of birds and mammals was not warranted.

Surface Water Screening Levels

For the surface water data set, the maximum detected concentration of each chemical was compared to media-specific SEVs to assess the potential for risks to the aquatic community (i.e., aquatic invertebrates). Chemicals detected above these SEVs were identified as COPCs for further

evaluation in the Tier 2 BERA. Surface water SEVs were selected, when available, from the following hierarchy of sources:

- USEPA federal Ambient Water Quality Criteria (AWQC) (USEPA 2009).
- USEPA Region 3 Freshwater Screening Benchmarks (USEPA 2006a).
- Secondary Chronic Values (SCVs) from Suter and Tsao (1996).
- Surface water screening values from alternate sources (e.g., USEPA 2003; 2015) were considered when values are not available from the sources listed above.

For hardness-dependent criteria, a site-specific average hardness of 111 milligrams per liter (mg/L) was used to adjust the values.

Sediment Screening Levels

For the surface sediment data set, the maximum detected concentration of each chemical was compared to media-specific SEVs to assess the potential for risks to the benthic invertebrate community. Chemicals detected above these SEVs were identified as COPCs for further evaluation in the Tier 2 BERA. Sediment SEVs were selected, when available, from the following hierarchy of sources:

- Consensus-based Threshold Effects Concentrations (MacDonald et al. 2000).
- USEPA Region 3 Freshwater Sediment Screening Benchmarks (USEPA 2006b).
- Threshold Effect Levels from the National Oceanic and Atmospheric Administration Screening Quick Reference Tables (Buchman 2008).
- Sediment Quality Benchmarks derived by ORNL using SCVs and the theory of equilibrium partitioning (Jones et al. 1997).
- USEPA Region 5 Ecological Screening Levels derived by USEPA (2003).

Wildlife Dose-based TRVs

Risks to mammals and birds from exposure to chemicals in surface soil and sediment were determined using food web models to estimate the total daily dose (TDD), which was compared to chemical-specific TRVs representing acceptable daily doses in mg/kg-day. Only chemicals identified by USEPA as bioaccumulative (2000) were evaluated in the food web model.

Per the approach used at the VLF Peninsula and the SYA, the TRVs used in the ecological SRA were based on the maximum allowable threshold concentration (MATC). The MATC represents the geometric mean of TRVs based on the no-observed-adverse-effect level (NOAEL) and the lowest-observed-adverse-effect level (LOAEL). Both NOAEL- and LOAEL-based TRVs were

determined for each COPC for avian and mammalian receptors; the MATC value was used in the food web to evaluate potential risks to wildlife. The TRV relates the dose of a respective COPC from oral exposure with a potential adverse effect. If no toxicity information was available for a COPC, and it was not possible to identify TRVs, risks associated with the estimated exposure for the respective COPCs were not quantitatively evaluated. TRVs were identified for nearly all COPCs evaluated in the food web model.

TRVs incorporated into the quantitative evaluation of potential ecological risks to wildlife were obtained from the USEPA guidance for the development of Eco-SSLs (USEPA 2005) and ORNL's publication *Toxicological Benchmarks for Wildlife: 1996 Revision* (Sample et al. 1996).

Some TRVs are based on either a LOAEL or a NOAEL endpoint, without measurement of the corresponding value. In cases where the TRV was based on a NOAEL value, LOAEL was estimated from the NOAEL by using an uncertainty factor of 10 (USEPA 1997). Conversely, if the TRV is based on LOAEL, the NOAEL was estimated at 0.1 times the LOAEL value.

No body weight scaling was used to scale NOAELs (or LOAELs) for surrogate test species to an equivalent NOAEL (or LOAEL) for the receptor species. Therefore, $NOAEL_{receptor} = NOAEL_{test\ species}$ and $LOAEL_{receptor} = LOAEL_{test\ species}$.

3.1.7 COPC Selection

Maximum concentrations in surface soil, surface water, and sediment were compared to published SEVs to select COPCs. Chemicals that were detected at concentrations greater than the SEVs were selected as COPCs and risks are characterized in **Section 3.2.4**. Chemicals that were detected but do not have associated SEVs were also maintained as COPCs.

Twenty-three surface soil COPCs (**Table 1**) were identified. Two COPCs were retained due to lack of a SEV. The other 21 COPCs were retained due to SEV exceedances.

Twelve COPCs were identified in surface water (**Table 2**). One COPC, silver, was retained due to lack of a SEV. The other 11 COPCs were retained due to SEV exceedances. Three COPCs (barium, iron, and manganese) were retained in both the dissolved and total recoverable phases.

Twenty-nine COPCs were identified in surface sediment (**Table 3**). Five of the COPCs were retained due to lack of a SEV. The other 24 COPCs were retained due to SEV exceedances.

3.2 Step 2 – Exposure Estimation and Risk Characterization

Section 3.2 presents the methods and results of Step 2 of the ecological SRA process. This step comprises a semi-quantitative risk analysis, in which the potential for adverse effects to ecological receptors is estimated. **Section 3.2** is divided into four subsections: exposure estimation

(**Section 3.2.1**), risk calculations (**Section 3.2.2**), uncertainty analysis (**Section 3.2.3**), and risk characterization (**Section 3.2.4**). The COPCs identified in **Section 3.1.7** are the focus of this analysis.

3.2.1 Exposure Estimation

Mechanisms for exposure of a representative species to chemicals depend on the physical and behavioral characteristics of the organism. Most exposure for benthic invertebrates, aquatic invertebrates, soil invertebrates, and plants can be loosely termed "direct contact." Benthic invertebrates and soil invertebrates have in common the ability to absorb chemicals from sediment or moist soil through external body surfaces or by intake of food, sediment, or soil.

Wildlife species may be exposed to chemicals in soil, surface water, and sediment directly though ingestion (incidental or intentional) or indirectly through ingestion of contaminated food organisms. Information used to calculate exposure includes EPCs, species-specific exposure factors, chemical-specific exposure factors, and exposure equations.

Exposure Point Concentrations

Exposure was estimated using analytical data for surface soil, sediment, and tissue included in **Attachment A**. Maximum values were used as the EPCs in Tier 1, Step 2 of the ecological SRA for the COPCs per media identified in **Section 3.1.7**.

Species-Specific Exposure Factors

Table 4 presents the exposure factors for the selected ecological receptors. Exposure assumptions (e.g., body weights, food and water ingestion rates, relative consumption of food items, foraging range, exposure duration [ED], etc.) for wildlife species were generally obtained from the USEPA's Wildlife Exposure Factors Handbook (USEPA 1993). Alternate sources (e.g., USEPA 2007a; Beyer et al. 1994) were only used when the handbook did not provide sufficient information. Allometric equations (Nagy 2001; USEPA 1993) were used to estimate food ingestion rates.

This Tier 1 screening-level assessment included certain species- and chemical-specific assumptions regarding exposure factors:

- Assumed soil, surface water, and sediment COPC concentrations are represented by the maximum concentrations in the surface soil, surface water, and sediment data sets.
- Assumed representative species' weight and food intake rate are the average for the receptor (per the approach used for the VLF Peninsula).
- Assumed 100 percent bioavailability of COPCs.
- Assumed species is present year-round.

- Assumed that receptors obtain all of their daily dietary requirements from within the site.
- For the ecological SRA, diets of receptors were modeled as exclusive diets (i.e., consisting of 100 percent soil invertebrates, plants, or freshwater benthic invertebrates).

Chemical-Specific Exposure Factors

Exposure of representative species also depends, to some extent, on chemical-specific factors such as solubility or tendency to bioaccumulate. Site-specific data are preferred for evaluating the potential for bioaccumulation impacts; in the absence of these data, bioaccumulation factors may be used to estimate tissue concentrations. Site-specific tissue data is not available so abiotic media was used to estimate tissue concentrations.

For soil invertebrates, the site-specific soil-to-worm regression equations developed for the VLF Peninsula (Resolution 2016a) were used to estimate tissues at the former FTA (consistent with the approach used at the SYA). When regressions were not available from the VLF Peninsula, uptake factors or regression equations from the USEPA Eco-SSL Guidance (USEPA 2007a) were used. In the absence of values from these two sources, values were obtained from Sample et al. (1998) and the Los Alamos National Laboratory (LANL) EcoRisk Database (2015).

Site-specific plant tissue data were not available, so plant tissue concentrations were estimated using soil concentrations and appropriate uptake factors or regression equations. The primary source of uptake factors was the soil-to-plant uptake factors and regression equations recommended by USEPA in development of Eco-SSLs (USEPA 2007a). In the absence of Eco-SSL-based values, other literature sources such as the online Risk Assessment Information System (ORNL 2012) were reviewed for relevant uptake factors.

Site-specific freshwater benthic invertebrate tissue data were not available, so invertebrate tissue concentrations were estimated using sediment concentrations and appropriate uptake factors. Uptake factors for inorganics were preferentially selected from Bechtel Jacobs (1998). In the absence of values available from Bechtel Jacobs (1998), values were obtained from USEPA (1999). The USEPA's Biota-Sediment Accumulation Factor database was used to identify sediment-to-invertebrate uptake factors for PCBs.

Exposure Equations

To estimate potential dietary exposure, a TDD was estimated for each species. The TDD calculation considers the following factors: the concentrations of the COPCs in the food items that the species would consume, the estimated amounts of abiotic media (e.g., soil, sediment) that it would incidentally ingest, the relative amount of different food items in its diet, body weight, ED, species-specific area use factor (AUF), and food ingestion rates.

An AUF is defined as the ratio of the area of organisms' home range to the available habitat area onsite. In the screening level evaluation it was conservatively assumed that 100 percent of the receptor's diet comes from the given exposure area and there is no seasonal migration out of the exposure area (i.e., AUF of 1 and ED of 1 assumed). These assumptions are conservative for receptors which may migrate off site during parts of the year.

The following generalized equation was used to evaluate the TDD from all sources (i.e., food or prey item, drinking water, incidental ingestion) for each COPC:

$$TDD = \frac{\Sigma([IR_f \times C_f] + [IR_s \times C_s] + [IR_w \times C_w]) \times ED \times AUF}{\text{Body Weight}}$$

Where:

IR_f = Ingestion rate of food (kg_{dw}/day)
IR_s = Incidental ingestion rate of soil or sediment (kg_{dw}/day)
IR_w = Ingestion rate of water (L/day)
C_f = Concentration of COPC in food (mg_{dw}/kg)
C_s= Concentration of COPC in sediment or soil (mg_{dw}/kg)
C_w = Concentration of COPC in water (mg/L)
ED = Exposure duration (fraction of time receptor spends within exposure area)
AUF = Area use factor (ratio of the receptor's home range, etc., relative to the size of exposure area)

The sum of the doses from the various sources represents the full TDD from each COPC that a receptor may be exposed through as a result of foraging within an exposure area. This generalized equation was modified for each representative species using the exposure parameters presented in **Table 4**.

3.2.2 Risk Calculations

The integration of toxicity and exposure information is used to predict possible adverse effects to ecological receptors. The hazard quotient (HQ) method is used to screen sites when potential adverse effects to ecological receptors occur.

To estimate risks to plants, soil invertebrates, aquatic receptors, and benthic invertebrates in the ecological SRA, screening level HQs were calculated by comparing the maximum detected concentration for each chemical in each medium (i.e., an estimate of exposure) to the appropriate SEV (i.e., an estimate of effects) using the following formula:

$$HQ = \text{Maximum detected concentration/SEV}$$

For higher trophic level wildlife receptors, the risk estimate is also based on the HQ, defined as the ingested dose divided by the species-specific TRV:

$$HQ = TDD/TRV$$

Due to the consistently applied conservative assumptions implicit in a Tier 1 ecological SRA, the presence of HQs above 1 does not necessarily constitute ecological risk; only that additional consideration is warranted.

As described in **Section 3.1.7**, analytes with maximum detected concentrations above their respective screening benchmarks (i.e., HQs > 1) and analytes without screening benchmarks were retained as COPCs. Risks due to COPCs are characterized further in **Section 3.2.4**.

Comparison of Chemical Concentrations in Surface Soil to Soil SEVs

The potential effects on plants and soil invertebrates were evaluated by comparing maximum detected soil concentrations with direct contact soil screening levels. As indicated in **Table 5**, 19 COPCs have HQs above 1 when compared against the soil invertebrate-based SEVs and 11 COPCs have HQs above 1 when compared against the plant-based SEVs; these COPCs are recommended for the Tier 2 evaluation. Eight compounds are retained as COPCs due to a lack of SEVs.

Comparison of Chemical Concentrations in Freshwater Surface Water to Surface Water SEVs

The potential effects on the aquatic community (i.e., aquatic invertebrates present in the wetland) were evaluated by comparing maximum detected surface water concentrations with direct contact surface water screening levels. As indicated in **Table 6**, 14 COPCs have HQs above 1 and are recommended for the Tier 2 evaluation. One compound (silver) is retained as a COPC due to lack of a SEV.

Comparison of Chemical Concentrations in Freshwater Surface Sediment to Sediment SEVs

The potential effects on benthic invertebrates were evaluated by comparing maximum detected surface sediment concentrations with direct contact sediment screening levels. As indicated in **Table 7**, 24 COPCs have HQs above 1 and are recommended for the Tier 2 evaluation. Five compounds are retained as COPCs due to a lack of a SEV.

Comparison of Wildlife Total Daily Doses to MATC-based TRVs

Maximum media concentrations were used with the exposure assumptions presented in **Table 4** to calculate TDD values for each detected COPC for each wildlife receptor. All detected constituents in surface soil, freshwater sediment, and marine sediment were evaluated in the food web model.

Attachment E and **Attachment F** include the supporting information for the food web models for the terrestrial and freshwater exposure units, respectively. These attachments identify the media concentrations, TRVs, and equations used to calculate the TDD and HQs for both birds and mammals. Receptors and COPCs with MATC-based HQs above 1 are recommended for further evaluation in a Tier 2 evaluation.

Table 8 presents a summary of COPCs with food web HQs greater than 1 in the terrestrial exposure area. The terrestrial food web model evaluated the potential for wildlife risks within the former FTA using maximum detected concentrations in soil. The only HQ above 1 for the herbivores was for meadow vole exposed to PCBs. There were no exceedances for the bobwhite quail.

HQs above one were identified for multiple COPCs for the short-tailed shrew and American robin consuming exclusive diets of soil invertebrates. HQs above 1 were identified for cadmium, chromium, lead, mercury, selenium, zinc, LMW PAHs, high molecular weight (HMW) PAHs, 4,4-DDT, dieldrin, endrin, endrin aldehyde, endrin ketone, and Total PCBs for the American robin. HQs above 1 were identified for cadmium, selenium, zinc, HMW PAHs, dieldrin, endrin ketone, and Total PCBs for the short-tailed shrew.

Table 9 presents a summary of COPCs with food web HQs greater than 1 in the freshwater wetland exposure area. This food web model evaluated the potential for wildlife risks within freshwater wetland using maximum detected concentrations in sediment. It was assumed that the marsh wren and the raccoon both consumed diets exclusively containing benthic invertebrates. As indicated in **Table 9**, HQs above 1 were identified for copper, mercury, and selenium for the marsh wren and selenium for the raccoon.

3.2.3 Uncertainty Analysis

ERA results depend primarily on the use of multiple lines of evidence supporting particular conclusions, and each line of evidence is subject to varying degrees of uncertainty. Because of the complexity of ecosystems and the associated mechanisms that cause ecological stress, uncertainty in environmental risk characterization is inevitable. Uncertainty could be attributable to a number of sources, including but not limited to the following:

- Sampling and statistical variability
- Difficulty of extrapolating from laboratory data to field data

- Problems in evaluating environmental responses to mixtures of contaminants
- Range of conditions for which models or HQs are applicable

Additional sources of uncertainty associated with this ecological risk characterization are described below. In general, the assumptions made in multiple points in the ecological SRA tend to err on the side of overestimating risks. The cumulative impact of multiple conservative assumptions is more likely to overestimate than underestimate potential risks to ecological receptors.

Detected Chemicals that Lack Screening Levels

Soil SEVs were not available for dichlorodifluoromethane and methyl acetate which were detected in surface soil. Avian TRVs were not available for heptachlor epoxide. Sediment SEVs were not available for beryllium, thallium, 1,4-dioxane, carbazole, cis-1,2-dichloroethene, and methyl cyclohexane which were detected in freshwater sediment. A surface water SEV is not available for silver, which was detected in total recoverable, but not dissolved, surface water. These chemicals could not be quantitatively evaluated in the ecological SRA, but were selected as COPCs because with no SEV or TRV, it cannot be stated with certainty that those COPCs do not pose an ecological risk.

Uncertainties in Ecological Exposure Estimation

In general, the sampling targeted areas with the potential to have been impacted by historical activities in the former FTA, particularly within the DDA. However, these areas may not represent preferred ecological habitats or areas likely to be frequented by ecological receptors. This is particularly true in the terrestrial portions of the site, which are primarily open areas with limited vegetation which may be unattractive to some wildlife receptors. Therefore, ecological exposures to some samples may be limited or receptors may prefer to forage in other portions of the site. This type of sampling is expected to bias results high.

As described in the ERA for the VLF Peninsula (Resolution 2016a), there are some uncertainties associated with the site-specific regression models developed for use in the food web models using the VLF soil and earthworm tissue data sets. These uncertainties apply to the former FTA evaluation as well; however, there is a higher level of uncertainty associated with the former FTA evaluation since the soil and worm tissue used in the regressions were associated with the VLF towers and not the former FTA itself. The use of these regressions is discussed further in the Tier 2, Step 3a evaluation.

Total PCBs and Total PAHs were calculated as the sum of the individual detected PCBs or PAHs, respectively. However, it is possible that individual constituents are present at or below the reporting limits, so this methodology could underestimate the true totals. An alternate approach would be to treat the non-detect data as if it were detected and then sum the individual detections

and reporting limits. However, this approach is likely to overestimate risks. The potential uncertainties associated with the Total PCB and Total PAH calculations are discussed further in the Tier 2, Step 3a evaluation (**Section 4.5**).

Uncertainties in Ecological Toxicity Assessment

Toxicological studies reported in the literature used for generating screening or protective criteria may not have been obtained under conditions that accurately represent the complexities of potential exposures in the field.

The community-level screening benchmarks and wildlife TRVs used do not generally account for possible synergistic, antagonistic, or additive effects of COPC mixtures in environmental media. These factors may result in an underestimate or overestimate of potential risk. Assessing potential risks due to exposures to chemical mixtures is challenging since chemicals within the mixture may not be equally bioavailable and may not act on the receptor with the same toxic mechanisms.

3.2.4 Risk Characterization

The COPCs and receptors with HQs greater than 1 in the Tier 1 ecological SRA are summarized below and shown in **Table 10**.

Risk to Plants and Soil Invertebrates

The maximum detected concentrations for the surface soil COPCs identified in **Table 1** were compared against direct contact soil SEVs identified for both soil invertebrates and terrestrial plants; the resulting HQs are presented in **Table 5**.

Nineteen COPCs had HQs above 1 when maximum detected soil concentrations were compared against the soil invertebrate SEVs. These HQs ranged from 1.1 for vanadium to 22,000 for endosulfan sulfate. Eleven COPCs had HQs above 1 when maximum detected soil concentrations were compared against the terrestrial plant SEVs with HQs ranging from 1.9 for cobalt to 22,000 for endosulfan sulfate.

Risk to Freshwater Aquatic Receptors

The maximum detected concentrations for freshwater surface water COPCs identified in **Table 2** were compared against direct contact surface water SEVs. The resulting HQs are presented in **Table 6**.

Fourteen COPCs had HQs above 1 when maximum detected surface water concentrations were compared against the surface water SEVs. Barium, iron, and manganese were retained in both the dissolved and total recoverable phases. Aluminum, cadmium, iron, four SVOCs, and PCBs were retained only in the total recoverable phase. These HQs ranged from 3.4 for dissolved barium to

27.1 for total recoverable PCBs. Silver in the total recoverable, but not dissolved, phase was retained due to a lack of a SEV.

Risk to Freshwater Benthic Invertebrates

The maximum detected concentrations for freshwater sediment COPCs identified in **Table 2** were compared against direct contact sediment SEVs identified for freshwater benthic invertebrates. The resulting HQs are presented in **Table 7**.

Twenty-four COPCs had HQs above 1 when maximum detected sediment concentrations were compared against the benthic invertebrate SEVs. These HQs ranged from 1.3 for iron to 345 for acetone; however, acetone is a common laboratory contaminant and may not be site-related (several laboratory blanks had acetone contamination). Beryllium, thallium, carbazole, cis-1,2-dichlorophenol and methyl cyclohexane were retained due to a lack of a SEV.

Risk to Birds and Mammals

Risks to mammals and birds were assessed using food web models which estimated a TDD for each COPC and compared the dose to a chemical-specific, MATC-based TRV. **Attachment E** and **Attachment F** include the supporting calculations for the food web model; **Table 8** and **Table 9** summarize the HQs.

For the upland terrestrial receptors, the bobwhite quail and meadow vole were assumed to feed exclusively on plants and the American robin and short-tailed shrew were assumed to feed exclusively on soil invertebrates. The marsh wren and the raccoon were assumed to feed exclusively on freshwater benthic invertebrates in the freshwater wetland at the former FTA.

For the terrestrial food web, the following COPCs resulted in HQs above 1 for the American robin, meadow vole, or the short-tailed shrew in the terrestrial exposure area: cadmium, chromium, lead, mercury, selenium, zinc, HMW PAHs, LMW PAHs, Total PCBs, 4,4-DDT, dieldrin, endrin, endrin aldehyde, and endrin ketone. The HQs above 1 ranged from 1.1 for the American robin exposed to LMW PAHs to 627 for the short-tailed shrew exposed to Total PCBs. No HQs above 1 were identified for the bobwhite quail.

For the freshwater food web, HQs above 1 were identified for copper, mercury, and selenium for the marsh wren and for selenium for the raccoon. These HQs above 1 ranged from 3.9 for the wren exposed to copper to 12.5 for the wren exposed to selenium.

3.3 Tier 1 Conclusions/Recommendations

In this Tier 1 ecological SRA, it was determined that complete exposure pathways exist from the surface soil, freshwater surface water, and freshwater sediment at the former FTA to plants, soil

invertebrates, aquatic receptors, benthic invertebrates, and wildlife receptors. The ecological SRA identified potential concerns for ecological receptors from exposure to surface soil, surface water, and sediment that warrant further attention. **Table 10** summarizes the COPCs and receptors with HQs above 1 in the Tier 1 ecological SRA.

3.4 Tier 1, Step 2 Exit Criteria

One of three outcomes is possible at this point in the ecological SRA:

- There is adequate information to conclude that the ecological risks are negligible and, therefore, no need for remediation based on ecological risk.
- The information is not adequate to make a decision at this point; the ERA process will continue to the Tier 2, Step 3a BERA.
- The information indicates a potential for adverse ecological effects, and a more thorough assessment is warranted.

Maximum concentrations of certain metals, pesticides, SVOCs, VOCs, and Total PCBs pose potential risk to plants, invertebrates, and/or wildlife, with Tier 1 HQs greater than 1. Therefore, certain media and receptors at the former FTA fail the ecological SRA and these surface soil, surface water, and sediment pathways require further evaluation in a Tier 2 assessment.

3.5 Scientific/Management Decision Point

The Tier 1 ecological SRA is being submitted with the draft RI report for regulatory review. If necessary, a SMDP conference with the regulatory and Navy risk managers will be scheduled to discuss the Tier 1 results. Based on the results of the Tier 1 ecological SRA, a Tier 2, Step 3a BERA has been prepared to further assess the potential for adverse effects to ecological receptors associated with the former FTA. The Preliminary Tier 2 assessment will be revised in response to regulatory comments.

4.0 TIER 2 BASELINE ECOLOGICAL RISK ASSESSMENT

4.1 Introduction

The ecological SRA for the former FTA covered Tier 1, Steps 1 and 2, conducted in accordance with USEPA (1997) guidance. In **Section 4.1**, the preliminary Tier 2, Step 3a evaluation is presented based on the data reviewed for the Tier 1 ecological SRA but with site-specific adjustments to exposure and toxicity assumptions. The BERA Tier 2, Step 3a evaluates the same assessment endpoints as the Tier 1 ecological SRA, but only for pathways and COPCs that failed to be eliminated in the Tier 1 ecological SRA.

4.2 Overview of Tier 2, Step 3a BERA Process

The Tier 2 ERA is the BERA for a site. Per USEPA (1997) guidance, it applies a five-step process to evaluate ecological risks and determine whether site remediation is warranted from an ecological perspective. The five steps that make up Tier 2 are consistent with Steps 3 through 7 of the USEPA Superfund process for ERA (USEPA 1997). Under Navy protocol, the Tier 2 BERA includes two sets of decision criteria (Step 3a and Step 7) for exiting from or proceeding with the ERA process.

In recognition of the fact that a complete BERA encompassing Steps 3 through 7 of the risk assessment process is a lengthy and complex process, and that Steps 1 and 2 of the ecological SRA yields very conservative results, USEPA recognized the possibility of an intermediate decision point based on a refinement of the COPCs following completion of the ecological SRA (USEPA 2001a). This decision point is called Tier 2, Step 3a under Navy protocol. This evaluation is conducted using the same data set used for the ecological SRA, and does not require additional site-specific data collection. However, for the former FTA, the Step 3a evaluation considered background data that were not discussed in the ecological SRA.

The purpose of Tier 2, Step 3a is to reevaluate COPCs that were retained from Tier 1 for further evaluation in a Tier 2 BERA, and to identify and eliminate from further consideration those COPCs that were retained because of the use of conservative exposure scenarios (e.g., maximum concentrations). Using more realistic Tier 2, Step 3a assumptions, the Tier 1 ecological SRA risk estimates were recalculated for the pathways and COPCs retained at the end of the Tier 1 ecological SRA.

These recalculated risk estimates were used to refine the list of COPCs identified in the Tier 1 ecological SRA. Step 3a of Tier 2 refines the Tier 1 ecological SRA by asking:

- Do site concentrations exceed background levels?
- Are high concentrations and risks widespread across the site or limited to discrete locations (magnitude and extent of contamination and risk)?

- Could the COPC be in a chemical form that is less hazardous (bioavailability of the COPC)?
- Are the conservative exposure assumptions used in Tier 1 representative of site-specific exposure?

The adjusted exposure assumptions for Tier 2, Step 3a were refined from the Tier 1 exposure assumptions in **Section 3.2.1** and are discussed further in the following sections. The Navy Step 3a re-evaluation/refinement process follows these steps:

- Revise exposure assumptions and calculate Tier 2, Step 3a doses and HQ risk estimates.
- Apply both no-effect and low-effect SEVs and TRVs (as available) to provide a risk range for risk managers to consider.
- Identify COPCs with a HQ less than 1 and eliminate from further evaluation.
- For COPCs with a HQ greater than 1, compare media concentrations to background levels. Identify COPCs present at concentrations below background and propose these for elimination from further evaluation.
- For COPCs with a HQ greater than 1, consider bioavailability, identify COPCs likely to be biologically unavailable, and propose these for elimination from further evaluation.
- Review detection frequency to identify COPCs with low detection frequencies (and sufficient data for acceptable site characterization). If a COPC was detected in only a very small percentage of the samples collected (5 percent or less), the risk identified in the ecological SRA may be overestimated and further evaluation of the COPC is not warranted.

After the re-evaluation/refinement, the decision criteria for Tier 2 Step 3a include:

- If the re-evaluation of the conservative exposure assumptions used in the ecological SRA supports an acceptable risk determination for all COPCs, then a No Further Action designation is warranted, and the site exits the ERA process.
- If the re-evaluation of the conservative exposure assumptions does not support an acceptable risk for all chemicals, the BERA process continues to Step 3b and subsequent steps, or to remedial decisions.

Tier 2, Step 3a evaluation employs the same dose models and risk characterization methods as those described in **Section 3.2** for the Tier 1 ecological SRA, with appropriate adjustments to the values of some input parameters and media data sets.

4.3 Tier 2, Step 3a Refinement Approach

4.3.1 Refinement of the EPC

The EPCs considered in the ecological SRA represented the maximum detected concentrations in the relevant surface soil, surface water, and surface sediment data sets. Two EPCs were used in the Tier 2, Step 3a evaluation, a refined maximum EPC and an average EPC; these EPCs were based on a review of the maximum and average detected concentrations and values calculated using USEPA's ProUCL Version 5.1 software (USEPA 2013). The ProUCL software was used to calculate the upper confidence limit (UCL) on the arithmetic mean and the ProUCL-recommended UCL (i.e., 95 percent, 97.5 percent, 99 percent) was used as the selected UCL. ProUCL Version 5.0 recommends at least 10 to 15 distinct results for the most accurate and reliable UCL calculation.

UCLs were only calculated where at least 10 samples and at least 6 detects are available. The refined maximum EPC was selected as the lower of the UCL and the maximum detected concentration (USEPA 2002).

The ProUCL software was also used to calculate Kaplan-Meier method means for data sets containing non-detects. The average EPC used in the Tier 2, Step 3a evaluation was the average of the detected concentrations for data sets where all concentrations were detected, or the Kaplan-Meier mean when data sets included non-detects.

Attachment G includes the EPCs used in the Tier 2, Step 3a evaluation and the ProUCL exports presenting the calculation of the UCLs.

4.3.2 Refinement of Plant and Soil Invertebrate SEVs

In the Tier 1 ecological SRA, terrestrial plants and soil invertebrate endpoints were evaluated against conservative screening levels intended to be protective under most or all situations. These screening levels were primarily derived from three sources: the Eco-SSL guidance (USEPA 2005), CCME Soil Quality Guidelines (2002; 2015), and ORNL (Efroymson et al. 1997; Efroymson, Will, and Suter 1997). These screening levels were derived through literature surveys and typically represent low- or no-effect levels. In some cases, such as selenium, the screening levels for plants (0.52 mg/kg) are lower than natural concentrations in many soils.

An appropriate Tier 2, Step 3a risk range would be based on identifying LOAEL-based screening levels applicable to the species at the site. However, LOAEL-based screening levels are not typically available in the literature and have not been derived by USEPA or CCME. Therefore, additional evaluation in Tier 2, Step 3a is limited to the evaluation of the refined EPCs against the soil SEVs, comparison to background values, and discussion of COPC-specific factors that can affect bioavailability and toxicity.

4.3.3 Refinement of Surface Water SEVs

Alternative surface water SEVs were selected from federal freshwater acute AWQC (USEPA 2009) or ORNL Secondary Acute Values (SAVs) (Suter and Tsao 1996). For hardness-dependent criteria, a site-specific average hardness of 111 mg/L was used to adjust the values.

4.3.4 Refinement of Freshwater Benthic Invertebrate SEVs

Alternate freshwater sediment effects-based SEVs were identified when available. The probable effect concentrations (PECs) from the consensus-based sediment quality guidelines (MacDonald et al. 2000) were the primary source of refined sediment SEVs. Additional effects-based screening values from alternate sources (e.g., Buchman 2008) were considered when PECs were not available. **Attachment C** includes the SEVs used in the Tier 2, Step 3a evaluation.

4.3.5 Refinement of Wildlife Exposure Factors

The ecological SRA had assumed that wildlife receptors obtained all of their diets from within the former FTA and that the receptors were present and feeding year-round. This is likely an overly conservative assumption given the size of the former FTA (approximately 10.3 acres total including approximately 3.3 acres of wetlands), the expected migration of most birds, and the seasonal lack of access to benthic invertebrates and soil invertebrates due to winter conditions.

The refinement of exposure assumptions applied in the Tier 2, Step 3a evaluation includes the following:

- Assumed some species may migrate out of the area for a portion of the year (ED of 0.5 for American robin and marsh wren based on assumption that these birds migrate out of the area for the winter months [October through March]). Northern robins and marsh wrens migrate to warmer climates in the winter, departing between September and November and returning between February and May (USEPA 1993).
- Assumed that low temperature conditions limit activity of prey items (benthic invertebrates and soil invertebrates) and ground foraging. Air and soil temperatures fall close to or below 40 degrees Fahrenheit[1,2] for five to six months of the year. Earthworm activity slows down in response to low soil temperatures (Edwards and Bohlen 1996) and requires average soil temperatures of 36 degrees Fahrenheit or more to become active in the soil after seasonal hibernation (Teale 1951). An ED of 0.67 for the raccoon is used assuming that temperatures are below freezing for 4 months a year and benthic invertebrates are not accessible for

[1] Average air temperature for Cutler is below 40 degrees Fahrenheit for five out of 12 months (https://temperature.weatherdb.com/l/6225/Cutler-Maine).

[2] Monthly average soil temperatures in the Bear Brook Watershed in Maine were recorded at below 41 degrees Fahrenheit (5 degrees Celsius) for five to six months of the year in 2001-2004 (https://umaine.edu/bbwm/bbwm-characteristics/soils/soil-temperature/).

foraging. An ED of 0.5 for the short-tailed shrew is used based on assumption that foraging for soil invertebrates is unlikely in cold weather months (October through March).

- Assumed that, when present in the area, receptors may only obtain a portion of their diets from within the site (AUF < 1 for bobwhite quail and raccoon based on their average home ranges, both of which exceed the exposure area). Receptors with smaller home ranges (robin, wren, shrew, vole) are conservatively assumed to obtain all of their diet, when present, from the former FTA (AUF=1). Given the availability of quality terrestrial habitat surrounding the former FTA, this is a very conservative assumption since even small receptors are likely to forage in areas outside the former FTA.

4.3.6 Refinement of Wildlife TRVs

In Tier 2, Step 3a, the TDD calculated in the food web model was divided by both the NOAEL- and LOAEL-based TRVs to estimate the potential for adverse effects to ecological receptors over the range of toxicity levels. NOAEL-based TRVs represent a no-effect level of exposure, corresponding to the highest tested level showing no adverse effects. The LOAEL identifies the lowest level tested at which an adverse effect has been noted. The difference between the NOAEL and LOAEL response provides a natural range of response that can be used to estimate a risk range. The true toxicity threshold is likely to exist between these values for the test species, also subject to uncertainties when extrapolating from the test species to the representative species.

The Tier 2, Step 3a calculation of wildlife HQs presents both NOAEL- and LOAEL-based TRVs to provide risk managers a risk range to consider when making risk management decisions for the site.

4.4 Tier 2, Step 3a Risk Calculations

As described previously, based on the results of the ecological SRA, several COPCs and receptors were evaluated further in a Tier 2, Step 3a evaluation. The results of the Tier 2, Step 3a risk calculations are presented below, starting with a summary of the results of a background evaluation. Although risks are calculated for COPCs that fall within the range of background concentrations, it is assumed that these COPCs are not attributed to Navy activities.

4.4.1 Background Evaluation

Tier 2, Step 3a evaluation allows consideration of background concentrations when evaluating ecological risk. This step eliminates COPCs with a HQ greater than 1 if the COPC is consistent with background. Based on the results of the ecological SRA, surface soil, surface water, and sediment, data were evaluated against the background data sets in Appendix C of the RI report. The results of the background evaluation are summarized in the following paragraphs. Greater detail on the evaluation is included in Appendix C.

For surface soil, site concentrations of COPCs were compared to background concentrations. The statistical analyses and graphical displays indicate that site surface soil concentrations of cadmium, lead, mercury, selenium, and vanadium were found to be less than or similar to background soil.

Due to the small size of the background surface water and sediment data sets (n=3 or n=2), a robust statistical population comparison against the site data could not be conducted. Appendix C includes a tabular summary and a graphical display of the site and background data. Concentrations in several site samples fall within the range of the background data sets for surface water and sediment, and most, but not all, COPC concentrations in the wetland are similar to background.

4.4.2 Soil Invertebrates and Terrestrial Plants

Table 11 presents the refined evaluation of the terrestrial plant and soil invertebrate endpoints using the refined maximum and average EPCs in surface soil. As indicated in **Section 4.3.2**, LOAEL-based SEVs were not identified and the SEVs considered in this evaluation are the same as in the ecological SRA. The HQs are presented below and discussed in more detail in Risk Characterization (**Section 4.6**). As indicated in the background evaluation discussed previously, cadmium, lead, mercury, selenium, and vanadium are consistent with background conditions.

For soil invertebrates, HQs for 16 COPCs are above 1 using the refined maximum EPC. This includes manganese, Total PCBs, eight pesticides, four SVOCs, and two VOCs. When the average EPC is considered, thirteen COPCs are above 1.

For plants, HQs for 10 COPCs are above 1 using the refined maximum EPC. This includes three inorganics, Total PCBs, and six pesticides. When the average EPC is considered, 8 COPCs are above 1.

Of the soil COPCs with HQs above 1 for soil invertebrates and plants, selenium and vanadium concentrations within the former FTA appear to be similar to background based on the statistical and/or graphical comparisons included in Appendix C of the RI report.

One of the pesticides and two of the SVOCs with HQs above 1 for soil invertebrates or plants meet the low FOD threshold of less than or equal to 5 percent detected with at least 20 samples analyzed. Therefore, no further evaluation is warranted for endrin aldehyde, carbazole and dibenzofuran on the basis of low FOD.

4.4.3 Freshwater Aquatic Community

Table 12 presents a refined evaluation of the surface water SEV comparison using the refined maximum and average surface water EPCs and surface water SEVs. The HQs are presented in the following paragraphs and discussed in more detail in Risk Characterization (**Section 4.6**).

Background samples were collected from three upstream SYA wetland locations in May 2009. A review of the graphical comparisons of the background and site surface water data sets (Appendix C of the RI report) indicates overlapping ranges of concentrations for a number of COPCs.

For the aquatic community, only one metal (aluminum) in the total recoverable phase has a HQ greater than 1 using the refined maximum EPC. When the average EPC is considered, all HQs are below 1. Typically, aquatic receptors are more highly exposed to COPCs in the dissolved phase and none of the metals in the dissolved phase exceeded the refined surface water EPC (PCBs and PAHs were not sampled in the dissolved phase, but these organics are hydrophobic and more likely to be bound to particulate matter).

Concentrations of aluminum within the former FTA appear to be below background based on the graphical comparisons included in Appendix C of the RI report.

4.4.4 Freshwater Benthic Invertebrates

Table 13 presents a refined evaluation of the benthic invertebrate SEV comparison using the refined maximum and average sediment EPCs and effect-based SEVs. The HQs are presented below and discussed in more detail in Risk Characterization (**Section 4.6**). Background samples were collected from three upstream SYA wetland locations in May 2009. A review of the graphical comparisons of the background and site sediment data sets (Appendix C of the RI report) indicates overlapping ranges of concentrations for a number of COPCs.

The maximum EPC for Total PCBs slightly exceeded the effect-based SEV in with a HQ of 1.3.

Background comparisons were not possible for Total PCBs due to a lack of analyses for PCBs in the background samples (Appendix C of the RI report).

4.4.5 Wildlife Endpoints

A refined food web model was used to assess the potential for risks to mammals, birds, and COPCs retained after the screening level food web models (**Attachment H** and **Attachment I**). Refined evaluations were warranted for at least one COPC for the American robin, meadow vole, and the short-tailed shrew in the terrestrial exposure area, and the marsh wren and raccoon in the freshwater exposure area. The HQs are presented below and discussed in more detail in Risk Characterization (**Section 4.6**).

Consistent with the ecological SRA, the food web models assumed these receptors fed exclusively on either plants (meadow vole), earthworms (American robin and short-tailed shrew), or benthic invertebrates (marsh wren and raccoon). As discussed in **Section 4.3.5**, it was assumed that migration out of the area or cold weather conditions limited exposures for the wren, robin, raccoon, and shrew (ED=0.5). The average home range for the raccoon is larger than the wetland portion of

the former FTA, resulting in a calculated AUF of 0.0021 (Table 6, **Attachment I**). However, it was assumed that the raccoon would consume five percent of its diet (AUF=0.05) from the wetland to account for the former FTA wetlands potentially containing more attractive habitat than other nearby habitats.

For the remaining receptors (wren, robin, vole, and shrew), it was assumed that when the receptors were present, they forage only with in the subject exposure areas (AUF=1). This may be a conservative assumption since even small receptors may forage in other areas outside of the former FTA.

The results of the refined evaluations are presented in this section for each of the exposure areas and wildlife receptors. Both NOAEL- and LOAEL-based HQs were calculated using both refined maximum and average EPCs.

The American robin, meadow vole, and short-tailed shrew were evaluated in the refined food web models for the terrestrial area (**Attachment H**). **Table 14** provides a summary of the HQs for these receptors and the COPCs retained in the ecological SRA.

As indicated in the background evaluation discussed in **Section 4.4.1**, cadmium, lead, mercury, and selenium in surface soil are consistent with background conditions so the HQs above 1 identified in **Table 14** do not warrant further evaluation.

As indicated in the following table, HQs for the following COPCs were above 1 for the refined terrestrial food web model. All HQs for the meadow vole were below 1 in the refined terrestrial food web model.

Receptor	Refined Maximum EPC		Average EPC	
	NOAEL-based TRV	LOAEL-based TRV	NOAEL-based TRV	LOAEL-based TRV
American robin	Cadmium [a] Chromium Selenium [a] Zinc HMW PAH Total PCBs Dieldrin Endrin Endrin aldehyde Endrin ketone	Selenium [a] Total PCBs Endrin Endrin ketone	Chromium Selenium [a] Zinc Total PCBs Endrin Endrin aldehyde Endrin ketone	Selenium [a] Total PCBs Endrin ketone
Short-tailed shrew	Cadmium Selenium [a] Zinc HMW PAHs Total PCBs Dieldrin Endrin ketone	Selenium [a] Total PCBs	Cadmium Selenium [a] Total PCBs Dieldrin Endrin ketone	Selenium [a] Total PCBs

Note:
[a] Concentrations in surface soil (0-1 ft) at the former FTA are consistent with background.

The marsh wren and raccoon were evaluated in the refined food web models for the freshwater wetland area located to the north of the former FTA (**Attachment I**). Copper, mercury, and selenium were evaluated for the marsh wren and selenium was evaluated for the raccoon. Site-specific benthic invertebrate tissue data were not available, so tissue concentrations were estimated from sediment concentrations using regression equations. **Table 15** presents the results of the refined food web model for the wetland. All HQs for the raccoon were well below 1 in the refined food web model.

The graphical background evaluation included in Appendix C of the RI report indicates that copper, mercury, and selenium were also detected in background sediment; therefore, a portion of these HQs may be attributable to naturally occurring background conditions.

As indicated in the following table, HQs for the following COPCs were above 1 for the refined wetland food web model. No HQs for the raccoon were above 1 in the refined food web model.

Receptor	Refined Maximum EPC		Average EPC	
	NOAEL-based TRV	LOAEL-based TRV	NOAEL-based TRV	LOAEL-based TRV
Marsh wren	Copper Mercury Selenium [a]	Selenium	Copper Mercury [a] Selenium [a]	No HQs > 1

Note:
[a] EPC is within the range of background concentrations in sediment.

4.5 Tier 2 Uncertainty Analysis

The uncertainties described in **Section 3.2.3** for the Tier 1 ecological SRA also apply to the Tier 2, Step 3a analysis. In general, the use of refined EPCs and more realistic toxicity ranges (e.g., LOAELs) reduce the deliberate overestimation of risk inherent in the Step 1 ecological SRA. Nonetheless, the same type of uncertainties are also applicable to this level of analysis.

Uncertainties in Ecological Exposure Estimation

Assumptions regarding chemical bioavailability and mobility add uncertainty to the risk assessment. Extraction methods used to determine chemical concentrations in soil and sediment are rigorous and destructive; chemicals are often sorbed to soil or sediment particles such that they may not be available to ecological receptors under normal environmental conditions.

Organic carbon present in the soil and sediment can bind to non-ionic organic molecules and some inorganics, making them unavailable for absorption by plants or invertebrate organisms. Total organic carbon (TOC) content in the surface soils at former FTA was not measured, but TOC in soils at the SYA were below 1 percent and the former FTA soils may be in a similar range. TOC in the eight samples collected from within the former FTA wetlands ranged from 5.2 percent to 44 percent TOC, with an average of 16 percent, which may serve to bind some of the COPCs in the wetland sediments.

Bioavailability in prey items is likely overestimated because the food web models assumed that the COPCs consumed by wildlife receptors were present in a form that was 100 percent bioavailable (100 percent of the COPC is assimilated by the organism after ingestion); however, this is unlikely.

The food web model assumptions of exclusive diets and an AUF of 1 are also likely to be overly conservative. The marsh wren, robin, vole, and shrew were assumed to forage only within the subject exposure areas (i.e., wetland or terrestrial areas); however, given the availability of quality habitat surrounding the former FTA, this is a very conservative assumption and even small receptors are likely to forage in areas outside the former FTA. The insectivores (marsh wren, robin, and shrew) are also likely to feed on a more variable diet than was assumed in the food web model (i.e., 100 percent benthic or soil invertebrates) which would reduce COPC exposure and associated risks.

The estimate of uptake and/or bioaccumulation from environmental media into plants, invertebrates, and wildlife is a source of uncertainty in the ERA. Ideally, site-specific tissue data are available to incorporate into the food web model; however, these data were not consistently available for all exposure areas. In the absence of site-specific tissue data in the upland, uptake factors or regression models were used to estimate invertebrate tissue concentrations. These uptake factors, such as the SEVs and TRVs, were generally obtained from laboratory studies which

are more likely to overestimate rather than underestimate bioavailability because of the test conditions selected for laboratory studies (e.g., low pH and TOC).

Worm and soil concentrations from the VLF Peninsula were used to derive regression equations to predict worm tissue concentrations when site-specific worm tissue data are not available. As discussed in the ERA for the VLF Peninsula (Resolution 2016a), there are some uncertainties for these regression equations including lack of true co-location in time and space between soil and worm tissue samples and the fact that the regression data set does not capture the full range of soil concentrations across the peninsula.

In addition, these relationships are based on the assumption that there is a positive linear relationship between soil and worm tissue concentrations for all COPCs where increasing soil concentrations are correlated with increasing worm tissue concentrations. Positive regressions were calculated for all COPCs except thallium. The positive regressions for chromium, cobalt, lead, zinc, and Total PCBs were significant (p-value less than 0.05) whereas the positive regressions for antimony, cadmium, and selenium were not significant. All positive regression equations were used to derive worm tissue concentrations for the food web model regardless of statistical significance of the relationship on the basis that site-specific relationships between soil and tissue are more appropriate than literature-based uptake factors. However, for antimony, cadmium, and selenium, it is uncertain if the regressions are sufficient to establish a relationship between soil and worm tissue concentrations, and it is unknown if worm tissue concentrations are over- or underestimated as a result.

The VLF Peninsula regression models for earthworms often predict higher bioaccumulation into earthworms than would be predicted using literature-based models. For example, for a zinc soil concentration of 100 mg/kg, the VLF Peninsula regression model predicts an earthworm concentration of 2,281 mg/kg dw and the Eco-SSL regression predicts a tissue concentration of 387 mg/kg dw (approximately six times lower than predicted by the VLF Peninsula regression). Even with a zinc concentration of zero mg/kg in soil, the VLF Peninsula regression model predicts elevated zinc concentrations in worm tissue (1,264 mg/kg dw). This regression in particular appears to overestimate worm tissue concentrations of zinc at low soil concentrations. However, the worm tissue concentrations for several COPCs within the VLF Peninsula are elevated so it is possible that conditions on the peninsula result in higher bioaccumulation into worms than would be expected based on the literature. It is unknown if conditions within the former FTA would result in similarly elevated worm concentrations.

There is the potential for the Total PAH and Total PCB concentrations used in the ERA to underestimate risks because they are based on the sum of only the individual detected PAHs or PCBs within a sample. **Attachment J** includes a summary of the sample-by-sample Total PCB and

Total PAH concentrations for surface soil and sediment calculated using the two methods (i.e., assuming non-detects equal to zero and equal to the reporting limit).

As indicated in **Attachment J**, the maximum concentration of Total PCBs in soil (after treatment of field duplicates) is 622 mg/kg when the full reporting limit is used and 610 mg/kg, assuming non-detects are equal to zero and the maximum difference between the two methods is 11.7 mg/kg for a sample collected from location PCBAREA1-013 in 2013. Given the range of the Total PCB data in soil, the calculation methodology does not significantly alter the findings of the ERA. Similarly, the differences in the Total PCB concentrations in sediment are small (maximum difference of 0.262 mg/kg in a sample from location FTA-SED-06 from 2012) and do not change the findings of the ERA.

For Total PAHs in soil and sediment, there are larger differences between the two methods due to the greater number of non-detect results. In soil, the maximum concentration of Total PAHs in soil (after treatment of field duplicates) of 73 mg/kg is the same under both calculation methods and the maximum difference between the two methods is 17.9 mg/kg for a sample collected from location FTA-SB-200 in 2012. In sediment, the maximum Total PAH concentration of 43 mg/kg is the same under both calculation methods, and the maximum difference between the two methods is 13.2 mg/kg for a sample collected from location FTA-SED-05 in 2014.

In surface soil and sediment, the maximum concentrations of Total HMW and LMW PAHs are the same under both calculation methods. The maximum differences between the two methods ranged from 3.3 mg/kg for LMW PAHs in a sample collected from location FTA-SB-220 to 8.2 mg/kg for LMW PAHs in a sample collected from location FTA-SB-200. These increases are insufficient to change the overall findings for PAHs in the screening or food web models conducted for surface soil or sediment.

Overall, the results of the comparisons of PCB and PAH total calculations in **Attachment J** indicate that, while assuming non-detects are equal to the reporting limit (i.e., a more conservative assumption than used in the ERA) increases the EPCs, it does not change the overall findings of the ERA.

Uncertainties in Ecological Toxicity Assessment

While several COPCs had plant and invertebrate HQs greater than 1, risk is probably overestimated due to uncertainties in the SEVs and the likelihood that studies conducted in the laboratory with bioavailable chemicals are likely to overestimate risks under field conditions. Specific uncertainties in SEVs are identified in the following paragraphs for COPCs with HQs above 1 that were not excluded due to FOD or background comparisons in **Table 11**.

USEPA Region 4 soil invertebrate values were also used for endrin, endrin ketone, heptachlor epoxide, methoxychlor, 1,1-biphenyl, bis(2-ethylhexyl)phthalate, carbazole, dibenzofuran, acetone, and carbon disulfide. These values were based on recent USEPA Region 4 guidance (2015) which uses equilibrium partitioning as the basis to derive soil screening levels when screening values are not available from Eco-SSL documents, ORNL, or the LANL database. This model assumes that the water quality benchmarks derived to be protective of aquatic invertebrates in interstitial pore water are also protective of terrestrial invertebrates in soil. It is uncertain how applicable these values are to the soil conditions or soil invertebrates present at the former FTA.

USEPA Region 4 (2015) plant values were used for endrin and endrin ketone. The endrin value (also used as a surrogate for endrin ketone) is a no-effect level from the LANL database; a low-effect screening level from the LANL database would reduce the plant HQs tenfold.

Dutch soil benchmarks were used for endosulfan I, endosulfan II, and endosulfan sulfate. The Dutch Target Values are typically assumed to be 1 percent of the Maximal Permissible Risk (MPR) level for ecosystems, where the MPR is the concentration expected to be hazardous for 5 percent of the species in the ecosystem, or the 95 percent protection level. Therefore, these SEVs may be overly protective for use in a refined evaluation. There is less confidence in these benchmarks than in other benchmarks such as the Eco-SSLs which are not available for these chemicals.

The Total PCB SEVs for plants and soil invertebrates were screening levels derived by ORNL and CCME, respectively. The plant SEV of 40 mg/kg was based on studies conducted with agricultural plant species in sandy soils, which identified no effect levels ranging from 10 to 1000 mg/kg depending upon the species and endpoint (Efroymson et al. 1997). The LANL database identifies a no-effect SEV of 160 mg/kg and a low-effect SEV of 620 mg/kg for plants (LANL 2015); the soil EPCs are well below these alternate SEVs. The soil invertebrate SEV is the CCME soil contact guideline (33 mg/kg) for commercial land use (CCME 1999). This value is derived from studies for soil invertebrates and plants. Plant studies evaluated for the development of this guideline reported toxicity values ranging from 100 to 1000 mg/kg for growth and reproduction endpoints for corn, fescue, soybean, sorghum, and beets. Toxicity values for terrestrial invertebrates ranged from 1,200 to 2,500 mg/kg for survival endpoints for 7- to 14-day studies. To calculate the PCB guideline, CCME divided the lowest effects concentration (100 mg/kg) by an uncertainty factor of three to account for the limited availability of acceptable toxicity studies. The soil EPCs are below the toxicity values identified by CCME. A review of the plant and soil invertebrate SEVs indicates that PCB risks are likely overestimated by the use of these benchmarks.

The manganese soil invertebrate and plant SEVs were Eco-SSLs derived by USEPA based on a review and evaluation of the available literature. There is more confidence in these values, relative to the ORNL and USEPA Region 4 values, since they are based on a more recent and

comprehensive review of the literature. However, nearly all of the studies used to derive these Eco-SSLs were conducted with agricultural plants such as alfalfa, soybean, cotton, and barley that may not be representative of the species found within the former FTA. In addition, adverse responses under laboratory conditions may not occur in the field.

The selected Eco-SSL for plants or invertebrates is typically the geometric mean of toxicity test data reported for plants and invertebrates based on studies that meet the Eco-SSL acceptability criteria. The Eco-SSLs are used as screening-level guidelines, are considered conservative, and are not predictive of risks (USEPA 2005). Therefore, the highest acceptable toxicity result included in the studies to derive the Eco-SSLs was evaluated for the COPCs below as a refined SEV relative to the refined maximum and average EPCs presented in **Table 11**.

- The manganese invertebrate Eco-SSL (450 mg/kg) (USEPA 2007b) is based on the geometric mean of three 20-percent effective concentration (EC_{20}) values reported in three studies covering invertebrate species (potworm, springtail, and earthworm). The highest EC_{20} value reported for these studies is 1209 mg/kg for the springtail. The average soil EPC is well below this value and the refined maximum is only slightly higher than this value, indicating that overall risks to invertebrates based on the Eco-SSL may be overestimated. Only three samples from the northern portion of the site (FTA-SB-200, FTA-SB-201, and FTA-SB-219) exceed the EC_{20} value of 1209 mg/kg; therefore, potential manganese concerns may occur within a limited area.
- The manganese plant Eco-SSL (220 mg/kg) (USEPA 2007b) is based on the geometric mean of four growth MATC values reported in three studies covering three plant species (barley, cotton, and Nile grass). The highest MATC value identified for manganese is 707 mg/kg for cotton and Nile grass. The refined maximum and average soil EPCs are both above this value; however, only three samples from the northern portion of the site (FTA-SB-200, FTA-SB-201, and FTA-SB-219) exceed the MATC value of 707 mg/kg. Therefore, potential manganese concerns may occur within a limited area.

4.6 Tier 2, Step 3a Risk Characterization

For ecological receptors associated with the former FTA, the potential for risk cannot be excluded if a LOAEL-based HQ is greater than 1 and the site data are above background. In addition, some COPCs do not warrant further evaluation because they were detected infrequently.

Terrestrial Exposure Area

Table 16 summarizes the COPCs with HQs above 1 at the end of the Tier 2, Step 3a evaluation for the terrestrial exposure area. COPCs are identified in this table if a HQ above 1 was noted for a receptor using the refined SEVs.

As indicated in **Table 16**, three organic COPCs (endrin aldehyde, carbazole, and dibenzofuran) were eliminated from further evaluation based on low FOD (less than or equal to 5 percent detected with at least 20 samples analyzed). Two COPCs (selenium and vanadium) are eliminated from further evaluation based on consistency with background. The remaining COPCs with HQs above 1 in the Step 3a evaluation are discussed in the following paragraphs.

The soil invertebrate HQs are greater than 1 for manganese, Total PCBs, dieldrin, endosulfan I, endosulfan II, endosulfan sulfate, endrin, endrin ketone, heptachlor epoxide, methoxychlor, 1,1-biphenyl, bis(2-ethylhexyl)phthalate, acetone, and carbon disulfide in the Tier 2, Step 3a evaluation using the refined maximum EPCs and for all of the same COPCs except Total PCBs, dieldrin, and 1,1-biphenyl using the average EPCs.

The plant HQs are greater than 1 for manganese, Total PCBs, endosulfan I, endosulfan II, endosulfan sulfate, endrin, and endrin ketone in the Tier 2, Step 3a evaluation using the refined maximum EPCs, and greater than 1 for all of the same COPCs except Total PCBs using the average EPCs.

The elevated HQs shown in **Table 11** are expected to overestimate risk to plants and invertebrates based on the very conservative nature of the benchmarks, and the fact that these COPCs may be less bioavailable and toxic in the former FTA soils, relative to the test chemicals and soils used in the toxicity tests on which the benchmarks are based. In particular for the pesticides, the EPCs may overestimate site-wide risks because UCLs could not be calculated for many of these COPCs, and because the average EPCs are based on a small number of detected samples (although not few enough to meet the low FOD threshold). As indicated in **Section 4.5**, there are uncertainties associated with the SEVs for the organic COPCs (based on Region 4 equilibrium partitioning or Dutch values) and Total PCBs.

Potential manganese risks to plants and invertebrates cannot be ruled out based on background or the SEV toxicity review. However, given the relatively low magnitude of the exceedances relative to the alternate toxicity values, the infrequency of the exceedances (three samples in the northern portion of the site), and the much lower manganese concentrations in the nearby restored Sand Wedge wetland (maximum of 496 mg/kg in sediment), it is expected that risks to plants and soil invertebrates are overestimated and not sufficient to warrant carrying these COPCs further in the ERA process.

The terrestrial food web models are included in **Attachment H** and summarized in **Table 14**, and identified HQs above 1 for the American robin and the short-tailed shrew for several COPCs. The models used to evaluate these receptors may overestimate potential risks because they assume that the receptors are only foraging on soil invertebrates within the terrestrial exposure area. It is more likely that receptors are consuming a mixed diet from locations within and outside the former

FTA. In addition, the limited vegetation in the open terrestrial areas likely provide lower quality habitat (i.e., less attractive to receptors) than the surrounding forested areas outside of the former FTA. Therefore, the focus of the risk characterization is on COPCs and receptors with HQs above 1 when the average EPC and the LOAEL-based TRV are considered.

Selenium, Total PCBs, and endrin ketone are the only COPCs with HQs above 1 when the average EPC and LOAEL-based TRV are considered. These HQs range from 1.9 to 3.9 for the robin and from 2.3 to 2.9 for the shrew. The endrin ketone HQ for the shrew is below 1 when the average EPC and LOAEL-based TRV are considered. Based on the background evaluation included in Appendix C of the RI report, selenium is consistent with background and does not warrant further evaluation.

A review of the endrin ketone data indicates that the EPCs are driven up by three detected concentrations above 0.99 mg/kg from within the DDA. The associated risks to the robin and shrew are also driven by a soil-to-worm uptake factor from the LANL EcoRisk Database (LANL 2015) that is based on a calculated, not measured, uptake. Given the relatively low levels of endrin ketone detected in the majority of the samples and the uncertainties associated with the estimation of worm tissue concentrations, it is expected that risks to these receptors due to endrin ketone are overestimated and not sufficient to warrant carrying this COPC further in the ERA process.

Although the robin and shrew HQs for Total PCBs are relatively low and there are some conservative assumptions included in the refined food web model (exclusive worm diet; AUF of 1), there may be a potential for risks to small insectivorous birds and mammals due to exposure to Total PCBs. However, the refined food web model assumed a 100-percent earthworm diet for these receptors obtained only from within the terrestrial portion of the former FTA, when in reality this assumption is likely an overestimate and there may be low risk from the former FTA soils to these receptors.

Freshwater Exposure Areas

Table 17 summarizes the COPCs with HQs above 1 at the end of the Tier 2, Step 3a evaluation for the freshwater wetland exposure area.

As summarized in **Table 17**, in the surface water SEV comparisons for aquatic invertebrates, total recoverable phase aluminum results in a HQ above 1 in the Tier 2, Step 3a risk evaluation using the refined maximum EPC. When the average EPC is considered, all HQs are less than 1. None of the dissolved phase metals exceeded the refined SEVs and metals concentrations in most samples were similar to levels in background samples. The wetland does not support a fish community, so the surface water SEVs may be overly conservative for the aquatic community present in the wetland and no further evaluation is warranted.

In the freshwater sediment SEV comparisons summarized in **Table 17**, only the Total PCB HQ is above 1 for the refined maximum, but not average, EPC. Given the low magnitude of the HQs and the lack of other COPCs with HQs above 1, these results indicate that risks to benthic invertebrates are expected to be minimal within the wetlands of the former FTA and no further evaluation is warranted.

In the wetland food web model included in **Attachment I**, HQs above 1 were identified for the marsh wren, but not for the raccoon. The model for the wren may overestimate potential risks because it assumes that, when the wren is present, it only forages for benthic invertebrates within the wetlands of the former FTA. It is unlikely that the former FTA can support a population of wren and it is more likely that any wren present in the former FTA wetlands also forages from locations across, and potentially off, the peninsula. Therefore, the focus of the risk characterization is on COPCs and receptors with HQs above 1 when the average EPC and the LOAEL-based TRV are considered. These COPCs are summarized in **Table 15** (along with the results when the refined maximum EPCs and NOAEL-based TRVs are considered).

None of the COPCs had HQs above 1 when the average EPC and the LOAEL-based TRV were considered. Therefore, it can be concluded that risks to birds and mammals are expected to be minimal within the wetlands of the former FTA and no further evaluation is warranted.

4.7 ERA Summary and Conclusions

The Tier 1 ecological SRA concluded that inorganics, PCBs, pesticides, SVOCs, and VOCs associated with surface soil, surface water, or freshwater sediment at the former FTA may pose potential risk to plants, invertebrates, and/or wildlife. Based on the results of the Tier 1 ecological SRA, a preliminary Tier 2, Step 3a BERA has been prepared to further assess the potential for adverse effects to ecological receptors at the former FTA. The Tier 2, Step 3a risk evaluation for the former FTA evaluated COPCs that failed the Tier 1 ecological SRA. **Section 4.7** summarizes the results.

For terrestrial plants and soil invertebrates, HQs are greater than 1 for several inorganic and organic COPCs. Two inorganic COPCs with HQs above 1 are consistent with background (selenium, vanadium) and do not require further valuation; three organic COPCs are eliminated from further evaluation based on low FOD (endrin aldehyde, carbazole, and dibenzofuran). There are significant uncertainties about the true bioavailability and toxicity of the remaining COPCs to plants and invertebrates.

Based on a review of the SEV sources and additional toxicity information, and given the relatively low magnitude of the exceedances and the infrequency of the exceedances, it is expected that risks to plants and soil invertebrates are overestimated and not sufficient to warrant carrying these COPCs further in the ERA process.

For small insectivorous birds and mammals exposed to surface soil and earthworms, selenium, Total PCBs, and endrin ketone are the only COPCs with HQs above 1 when the average EPC and LOAEL-based TRV are considered. The average EPCs and LOAEL-based TRVs resulted in robin HQs above 1 for selenium (HQ=3.1), Total PCBs (HQ=1.9), and endrin ketone (HQ=3.9) and shrew HQs above 1 for selenium (HQ=2.3) and Total PCBs (HQ=2.9). As stated previously, selenium is consistent with background and the endrin ketone HQs are expected to overestimate risk due to the limited nature of the elevated concentrations and the uncertainties associated with the worm tissue estimates; therefore, these COPCs do not warrant further evaluation. Although the robin and shrew HQs are relatively low, and there are some conservative assumptions included in the refined food web model (exclusive worm diet; AUF of 1), there may be a potential for risks to small insectivorous birds and mammals due to exposure to Total PCBs. However, as stated previously, the refined food web model assumption of a 100-percent earthworm diet from the former FTA for these receptors likely overestimates risks and in reality, there may be low risk from the former FTA soils to these receptors.

In the wetland exposure area, risks are expected to be minimal and generally similar to background; no further evaluation is warranted for the aquatic community or the benthic invertebrate community. Risks to birds and mammals are also expected to be minimal within the wetlands of the former FTA and no further evaluation is warranted.

TRICHLOROETHENE	1 : 42	0.0078	5.0	CCME (residential/parkland)	NO	Max Detect < SEV

Notes:
All results reported in milligrams per kilogram (mg/kg).
CCME - Canadian Council of Ministers of the Environment (2002; 2015). Values for environmental health selected.
COPC - Chemical of Potential Concern.
Eco-SSL - Ecological Soil Screening Level. Derived by USEPA according to USEPA guidance (2005a).
HPAH - High molecular weight PAH.
LPAH - Low molecular weight PAH.
NA - Not available/applicable.
ORNL - Oak Ridge National Laboratory (Efroymson, et al., 1997a and b).
PAH - Polycyclic Aromatic Hydrocarbon.
SEV - Screening Ecotoxicity Value.
TV - Target Value (Dutch standards presented in Buchman, 2008).
USEPA - United States Environmental Protection Agency.
USEPA R4 - USEPA Region 4 recommended ecological screening values for soil (USEPA, 2001).

[a] Lowest of the SEVs for terrestrial plants and soil invertebrates. See Attachment D for details.
[b] Average of soil pH measurements is 6.0 SU. See Attachment A for data (24 samples collected).

ACETONE	9.3	1500	USEPA R3	NO	Max Detect < SEV
TOLUENE	5.1	2.0	USEPA R3	YES	Max Detect > SEV

Notes:
All screening values reported in micrograms per liter (ug/L).
AWQC - Ambient Water Quality Criteria (chronic values; USEPA, 2014).
COPC - Chemical of Potential Concern.
NA - Not available/applicable.
SEV - Screening Ecotoxicity Value.
USEPA - United States Environmental Protection Agency.
USEPA R3 - USEPA Region 3 freshwater screening values (USEPA, 2006b).
USEPA R4 - EPA Region 4 recommended ecological screening values for surface water (USEPA, 2001).

[a] See Attachment D for SEVs.
[b] Value is hardness dependent. The site specific average hardness value of 111 mg/L $CaCO_3$ was used in the calculation.
[c] Value for benzo(a)pyrene used as a surrogate due to structural similarities (high molecular weight polycyclic aromatic hydrocarbons).

General Notes:
See individual organism notes for source, units, and conversion.
All receptors assumed to be present and actively foraging year-round in screening level evaluation (area use factor [AUF] and exposure duration [ED] set at 100%).

BW - Body Weight.
DW - Dry Weight.
FIR - Food Ingestion Rate.
Kg - Kilogram.
L/day - Liters per Day.

Notes for Bobwhite quail
[a] Average of adult body weights listed by USEPA (1993).
[b] Average food ingestion rate of 0.078 g/g/day (USEPA, 1993) multiplied by average body weight of 0.1751 kg (USEPA, 1993) and 0.15 to convert to dry weight (grass ingestion).
[c] An exclusive terrestrial plant diet was selected.
[d] The incidental soil ingestion rate is based on 50th percentile value for mourning dove (USEPA, 2007a).
[e] Water ingestion rate of 0.13 L/day (USEPA, 1993) multiplied by average body weight.

Notes for American robin
[a] Average of adult body weights listed by USEPA (1993).
[b] Food ingestion rates were calculated from Nagy et al. (1999) for insectivorous birds as follows:
FIR (kJ/day)= (9.7*BW(g) $^{0.705}$) using average body weight of 0.0804 kg (USEPA, 1993). FIR is converted to kg/day by dividing by 18 kJ/g of dry matter for avian insectivores (Nagy et al., 1999) and then dividing by 1000.
[c] An exclusive soil invertebrate diet was selected.
[d] In the absence of data for the robin, the incidental soil ingestion rate is based on 50th percentile value for woodcock (USEPA, 2007a).
[e] Water ingestion rate of 0.14 L/day (USEPA, 1993) multiplied by average body weight.

TABLE 4
EXPOSURE PARAMETERS FOR WILDLIFE RECEPTORS
ECOLOGICAL RISK ASSESSMENT
FIRE TRAINING AREA, NCTAMS LANT DET CUTLER
CUTLER, MAINE

Notes for Marsh Wren
[a] Average of adult body weights listed by USEPA (1993).
[b] Food ingestion rate calculated using algorithm for insectivorous birds developed by Nagy, 2001 [FIR (g_{dw}/day) = 0.540*$BW^{0.705}$] using average body weight.
[c] An exclusive diet was selected. Benthic invertebrates assumed to represent most relevant dietary exposure for the site.
[d] In the absence of data for the wren, the incidental soil ingestion rate is based on the mallard based on dietary similarities (USACHPPM, 2004).
[e] Water ingestion rate calculated using algorithm for all birds developed by Calder and Braun, 1983 [WIR (kg/day) = 0.059*$BW^{0.67}$] using average body weight.

Notes for Meadow vole
[a] Average of adult body weights listed by USEPA (1993).
[b] Average food ingestion rate of 0.33 g/g/day (USEPA, 1993) multiplied by average body weight of 0.0358 kg (USEPA, 1993) and 0.15 to convert to dry weight (grass ingestion).
[c] An exclusive terrestrial plant diet was selected.
[d] The incidental soil ingestion rate is based on 50th percentile value for vole (USEPA, 2007a).
[e] Maximum water ingestion rate of 0.21 L/day (USEPA, 1993) multiplied by average body weight.

Notes for Short-tailed shrew
[a] Average of adult body weights listed by USEPA (1993).
[b] Average food ingestion rate of 0.555 g/g/day (USEPA, 1993) multiplied by average body weight of 0.0161 kg (USEPA, 1993) and 0.16 to convert to dry weight (earthworm ingestion).
[c] An exclusive soil invertebrate diet was selected.
[d] The incidental soil ingestion rate is based on 50th percentile value for shrew (USEPA, 2007a).
[e] Water ingestion rate of 0.223 L/day (USEPA, 1993) multiplied by average body weight.

Notes for Raccoon
[a] Average of adult body weights listed by USEPA (1993; value is average of the average values from three studies).

[b] Food ingestion rate calculated using algorithm for carnivores developed by Nagy, et al. (1999) as follows:
FIR (kJ/day)= (2.23*BW(g) $^{0.85}$) using average body weight of 5.636 kg (USEPA, 1993). FIR is converted to kg/day by dividing by 18.7 kJ/g of dry matter for mammalian insectivores (Nagy et al., 1999) and then dividing by 1000.
[c] An exclusive diet was selected. Benthic invertebrates assumed to represent most relevant dietary exposure for the site.
[d] The incidental soil ingestion rate is based on the value identified by Beyer (1994) for raccoons.
[e] Water ingestion rate calculated using algorithm for all mammals developed by Calder and Braun, 1983 [WIR (kg/day) = 0.099*$BW^{0.90}$] using average body weight.

Notes:
All results reported in milligrams per kilogram (mg/kg).

CCME - Canadian Council of Ministers of the Environment (2002; 2015). Values for environmental health selected.
COPC - Chemical of Potential Concern.
Eco-SSL - Ecological Soil Screening Level. Derived by USEPA according to USEPA guidance (2005a).
EPC - Exposure Point Concentration (see Attachment I for details).
FOD - Frequency of Detection.
HPAH - High molecular weight PAH.
HQ - Hazard Quotient (EPC/SEV).
NA - Not available/applicable.
ORNL - Oak Ridge National Laboratory (Efroymson, et al., 1997a and b).
PAH - Polycyclic Aromatic Hydrocarbon.
SEV - Screening Ecotoxicity Value.
TV - Target Value (Dutch standards presented in Buchman, 2008).
USEPA - United States Environmental Protection Agency.
USEPA R4 - USEPA Region 4 recommended ecological screening values for soil (USEPA, 2001).

[a] SEVs for terrestrial plants and soil invertebrates presented in Attachment D.

[b] Eliminated as a COPC due to low FOD (< 5% detected with at least 20 samples).

[c] COPC is consistent with background conditions based on statistical and/or graphical displays (see Appendix C of the RI).

Notes:
All screening values reported in micrograms per liter (ug/L).
AWQC - Ambient Water Quality Criteria (USEPA, 2014).
COPC - Chemical of Potential Concern.
NA - Not available/applicable.
ORNL SAV - Oak Ridge National Laboratory Secondary Acute Value (Suter and Tsao, 1996).
SEV - Screening Ecotoxicity Value.
USEPA - United States Environmental Protection Agency.
USEPA R3 - USEPA Region 3 freshwater screening values (USEPA, 2006b).

[a] See Attachment D for SEVs.
[b] Value is hardness dependent. The site specific average hardness value of 111 mg/L CaCO3 was used in the calculation.
[c] Refined maximum and average EPC are within range of background surface water concentrations.
[d] Average EPC is within range of background surface water concentrations.

Notes:
[a] COPC is consistent with background conditions based on statistical and/or graphical displays (see Appendix C of the RI).
Refined maximum EPCs are the recommended upper confidence limit (UCL) on the arithmetic mean (or the maximum detected concentration if a UCL could not be calculated).
Average EPCs represent the average of the detects (if all samples were detected) or the Kaplan-Meier mean (if data set included non-detects).
Potential risk is calculated using the refined maximum and average EPCs and NOAEL- and LOAEL-based TRVs.
HQs above 1 are bolded and highlighted.

COPC - Chemical of Potential Concern.
HPAH - High molecular weight PAH.
HQ - Hazard Quotient.
LOAEL - Lowest Observed Adverse Effect Level.
LPAH - Low molecular weight PAH.
NC - Not Calculated. Avian TRV not available.
nCOPC - Not a COPC for this media/receptor combinaion.
NOAEL - No Observed Adverse Effect Level.
TRV - Toxicity Reference Value.

Notes:
COPC listed if HQ was above 1 in one of the Step 3a evaluations summarized in Tables 11 and 14.
Findings reflect results of screening with soil SEVs and LOAEL-based TRVs for wildlife.
No LOAEL-based HQs > 1 were calculated for the meadow vole or bobwhite quail so receptors are not listed on this table.

[a] COPC is consistent with background conditions based on statistical and/or graphical displays (see Appendix C of the RI).
[b] - FOD in soil is less than or equal to 5% with at least 20 samples analyzed.

X - COPC in the specified medium.
-- - not detected and/or not retained as a COPC.
COPC - Chemical of Potential Concern.
EPC - Exposure Point Concentration.
FOD - Frequency of Detection.
HQ - Hazard Quotient.
LOAEL - Lowest Observed Adverse Effect Level.
SEV - Screening Ecological Value.
TRV - Toxicity Reference Value.

Notes:
< - Result not detected above laboratory reporting limit.
CAS - Chemical Abstracts Service.
EPH - Extractable Petroleum Hydrocarbons.
FD - Field duplicate.
ft - feet.
J - Estimated value.
HPAH - High molecular weight PAH.
LPAH - Low molecular weight PAH.
mg/kg - milligram per kilogram.
N - Normal sample.
PAH - Polycyclic Aromatic Hydrocarbon.
PCB - Polychlorinated Biphenyl.
R - Rejected.
SVOC - Semivolatile organic compound.
TPH - Total Petroleum Hydrocarbon.
U - Not detected.
UJ - The analyte was not detected; and the reporting limit is approximate.
UR - Unreported/rejected.
VOC - Volatile organic compound.
VPH - Volatile Petroleum Hydrocarbons.
(a) Lab calculated value; only used when individual compound data not available.
(b) Total concentrations for use in the risk assessment were calculated per sample by summing only the detected individual compounds (i.e., Aroclor/PAH/xylene) concentrations. For samples without any detections of individual compounds (i.e., Aroclor/PAH/xylene), the maximum reporting detection limit within the sample is presented as a non-detect value. Calculated totals have a CAS number beginning with "RA-".
(c) Chromium III concentrations were calculated by the laboratory by subtracting chromium IV from total chromium, and were reported to two significant figures. Where chromium IV was not detected, the chromium III concentration was reported as the total chromium concentration at two significant figures.

Notes:
< - Result not detected above laboratory reporting limit.
CAS - Chemical Abstracts Service.
EPH - Extractable Petroleum Hydrocarbons.
FD - Field duplicate.
ft - feet.
J - Estimated value.
HPAH - High molecular weight PAH.
LPAH - Low molecular weight PAH.
mg/kg - milligram per kilogram.
N - Normal sample.
PAH - Polycyclic Aromatic Hydrocarbon.
PCB - Polychlorinated Biphenyl.
R - Rejected.
SVOC - Semivolatile organic compound.
TPH - Total Petroleum Hydrocarbon.
U - Not detected.
UJ - The analyte was not detected; and the reporting limit is approximate.
UR - Unreported/rejected.
VOC - Volatile organic compound.
VPH - Volatile Petroleum Hydrocarbons.
(a) Lab calculated value; only used when individual compound data not available.
(b) Total concentrations for use in the risk assessment were calculated per sample by summing only the detected individual compounds (i.e., Aroclor/PAH/xylene) concentrations. For samples without any detections of individual compounds (i.e., Aroclor/PAH/xylene), the maximum reporting detection limit within the sample is presented as a non-detect value. Calculated totals have a CAS number beginning with "RA-".
(c) Chromium III concentrations were calculated by the laboratory by subtracting chromium IV from total chromium, and were reported to two significant figures. Where chromium IV was not detected, the chromium III concentration was reported as the total chromium concentration at two significant figures.

Notes:
< - Result not detected above laboratory reporting limit.
CAS - Chemical Abstracts Service.
EPH - Extractable Petroleum Hydrocarbons.
FD - Field duplicate.
ft - feet.
J - Estimated value.
HPAH - High molecular weight PAH.
LPAH - Low molecular weight PAH.
mg/kg - milligram per kilogram.
N - Normal sample.
PAH - Polycyclic Aromatic Hydrocarbon.
PCB - Polychlorinated Biphenyl.
R - Rejected.
SVOC - Semivolatile organic compound.
TPH - Total Petroleum Hydrocarbon.
U - Not detected.
UJ - The analyte was not detected; and the reporting limit is approximate.
UR - Unreported/rejected.
VOC - Volatile organic compound.
VPH - Volatile Petroleum Hydrocarbons.
(a) Lab calculated value; only used when individual compound data not available.
(b) Total concentrations for use in the risk assessment were calculated per sample by summing only the detected individual compounds (i.e., Aroclor/PAH/xylene) concentrations. For samples without any detections of individual compounds (i.e., Aroclor/PAH/xylene), the maximum reporting detection limit within the sample is presented as a non-detect value. Calculated totals have a CAS number beginning with "RA-".
(c) Chromium III concentrations were calculated by the laboratory by subtracting chromium IV from total chromium, and were reported to two significant figures. Where chromium IV was not detected, the chromium III concentration was reported as the total chromium concentration at two significant figures.

Notes:
< - Result not detected above laboratory reporting limit.
CAS - Chemical Abstracts Service.
EPH - Extractable Petroleum Hydrocarbons.
FD - Field duplicate.
ft - feet.
J - Estimated value.
HPAH - High molecular weight PAH.
LPAH - Low molecular weight PAH.
mg/kg - milligram per kilogram.
N - Normal sample.
PAH - Polycyclic Aromatic Hydrocarbon.
PCB - Polychlorinated Biphenyl.
R - Rejected.
SVOC - Semivolatile organic compound.
TPH - Total Petroleum Hydrocarbon.
U - Not detected.
UJ - The analyte was not detected; and the reporting limit is approximate.
UR - Unreported/rejected.
VOC - Volatile organic compound.
VPH - Volatile Petroleum Hydrocarbons.
(a) Lab calculated value; only used when individual compound data not available.
(b) Total concentrations for use in the risk assessment were calculated per sample by summing only the detected individual compounds (i.e., Aroclor/PAH/xylene) concentrations. For samples without any detections of individual compounds (i.e., Aroclor/PAH/xylene), the maximum reporting detection limit within the sample is presented as a non-detect value. Calculated totals have a CAS number beginning with "RA-".
(c) Chromium III concentrations were calculated by the laboratory by subtracting chromium IV from total chromium, and were reported to two significant figures. Where chromium IV was not detected, the chromium III concentration was reported as the total chromium concentration at two significant figures.

Notes:
< - Result not detected above laboratory reporting limit.
CAS - Chemical Abstracts Service.
EPH - Extractable Petroleum Hydrocarbons.
FD - Field duplicate.
ft - feet.
J - Estimated value.
HPAH - High molecular weight PAH.
LPAH - Low molecular weight PAH.
mg/kg - milligram per kilogram.
N - Normal sample.
PAH - Polycyclic Aromatic Hydrocarbon.
PCB - Polychlorinated Biphenyl.
R - Rejected.
SVOC - Semivolatile organic compound.
TPH - Total Petroleum Hydrocarbon.
U - Not detected.
UJ - The analyte was not detected; and the reporting limit is approximate.
UR - Unreported/rejected.
VOC - Volatile organic compound.
VPH - Volatile Petroleum Hydrocarbons.
(a) Lab calculated value; only used when individual compound data not available.
(b) Total concentrations for use in the risk assessment were calculated per sample by summing only the detected individual compounds (i.e., Aroclor/PAH/xylene) concentrations. For samples without any detections of individual compounds (i.e., Aroclor/PAH/xylene), the maximum reporting detection limit within the sample is presented as a non-detect value. Calculated totals have a CAS number beginning with "RA-".
(c) Chromium III concentrations were calculated by the laboratory by subtracting chromium IV from total chromium, and were reported to two significant figures. Where chromium IV was not detected, the chromium III concentration was reported as the total chromium concentration at two significant figures.

Notes:
< - Result not detected above laboratory reporting limit.
CAS - Chemical Abstracts Service.
EPH - Extractable Petroleum Hydrocarbons.
FD - Field duplicate.
ft - feet.
J - Estimated value.
HPAH - High molecular weight PAH.
LPAH - Low molecular weight PAH.
mg/kg - milligram per kilogram.
N - Normal sample.
PAH - Polycyclic Aromatic Hydrocarbon.
PCB - Polychlorinated Biphenyl.
R - Rejected.
SVOC - Semivolatile organic compound.
TPH - Total Petroleum Hydrocarbon.
U - Not detected.
UJ - The analyte was not detected; and the reporting limit is approximate.
UR - Unreported/rejected.
VOC - Volatile organic compound.
VPH - Volatile Petroleum Hydrocarbons.
(a) Lab calculated value; only used when individual compound data not available.
(b) Total concentrations for use in the risk assessment were calculated per sample by summing only the detected individual compounds (i.e., Aroclor/PAH/xylene) concentrations. For samples without any detections of individual compounds (i.e., Aroclor/PAH/xylene), the maximum reporting detection limit within the sample is presented as a non-detect value. Calculated totals have a CAS number beginning with "RA-".
(c) Chromium III concentrations were calculated by the laboratory by subtracting chromium IV from total chromium, and were reported to two significant figures. Where chromium IV was not detected, the chromium III concentration was reported as the total chromium concentration at two significant figures.

Notes:
< - Result not detected above laboratory reporting limit.
CAS - Chemical Abstracts Service.
EPH - Extractable Petroleum Hydrocarbons.
FD - Field duplicate.
ft - feet.
J - Estimated value.
HPAH - High molecular weight PAH.
LPAH - Low molecular weight PAH.
mg/kg - milligram per kilogram.
N - Normal sample.
PAH - Polycyclic Aromatic Hydrocarbon.
PCB - Polychlorinated Biphenyl.
R - Rejected.
SVOC - Semivolatile organic compound.
TPH - Total Petroleum Hydrocarbon.
U - Not detected.
UJ - The analyte was not detected; and the reporting limit is approximate.
UR - Unreported/rejected.
VOC - Volatile organic compound.
VPH - Volatile Petroleum Hydrocarbons.
(a) Lab calculated value; only used when individual compound data not available.
(b) Total concentrations for use in the risk assessment were calculated per sample by summing only the detected individual compounds (i.e., Aroclor/PAH/xylene) concentrations. For samples without any detections of individual compounds (i.e., Aroclor/PAH/xylene), the maximum reporting detection limit within the sample is presented as a non-detect value. Calculated totals have a CAS number beginning with "RA-".
(c) Chromium III concentrations were calculated by the laboratory by subtracting chromium IV from total chromium, and were reported to two significant figures. Where chromium IV was not detected, the chromium III concentration was reported as the total chromium concentration at two significant figures.

Notes:
< - Result not detected above laboratory reporting limit.
CAS - Chemical Abstracts Service.
EPH - Extractable Petroleum Hydrocarbons.
FD - Field duplicate.
ft - feet.
J - Estimated value.
HPAH - High molecular weight PAH.
LPAH - Low molecular weight PAH.
mg/kg - milligram per kilogram.
N - Normal sample.
PAH - Polycyclic Aromatic Hydrocarbon.
PCB - Polychlorinated Biphenyl.
R - Rejected.
SVOC - Semivolatile organic compound.
TPH - Total Petroleum Hydrocarbon.
U - Not detected.
UJ - The analyte was not detected; and the reporting limit is approximate.
UR - Unreported/rejected.
VOC - Volatile organic compound.
VPH - Volatile Petroleum Hydrocarbons.
(a) Lab calculated value; only used when individual compound data not available.
(b) Total concentrations for use in the risk assessment were calculated per sample by summing only the detected individual compounds (i.e., Aroclor/PAH/xylene) concentrations. For samples without any detections of individual compounds (i.e., Aroclor/PAH/xylene), the maximum reporting detection limit within the sample is presented as a non-detect value. Calculated totals have a CAS number beginning with "RA-".
(c) Chromium III concentrations were calculated by the laboratory by subtracting chromium IV from total chromium, and were reported to two significant figures. Where chromium IV was not detected, the chromium III concentration was reported as the total chromium concentration at two significant figures.

Notes:
< - Result not detected above laboratory reporting limit.
CAS - Chemical Abstracts Service.
EPH - Extractable Petroleum Hydrocarbons.
FD - Field duplicate.
ft - feet.
J - Estimated value.
HPAH - High molecular weight PAH.
LPAH - Low molecular weight PAH.
mg/kg - milligram per kilogram.
N - Normal sample.
PAH - Polycyclic Aromatic Hydrocarbon.
PCB - Polychlorinated Biphenyl.
R - Rejected.
SVOC - Semivolatile organic compound.
TPH - Total Petroleum Hydrocarbon.
U - Not detected.
UJ - The analyte was not detected; and the reporting limit is approximate.
UR - Unreported/rejected.
VOC - Volatile organic compound.
VPH - Volatile Petroleum Hydrocarbons.
(a) Lab calculated value; only used when individual compound data not available.
(b) Total concentrations for use in the risk assessment were calculated per sample by summing only the detected individual compounds (i.e., Aroclor/PAH/xylene) concentrations. For samples without any detections of individual compounds (i.e., Aroclor/PAH/xylene), the maximum reporting detection limit within the sample is presented as a non-detect value. Calculated totals have a CAS number beginning with "RA-".
(c) Chromium III concentrations were calculated by the laboratory by subtracting chromium IV from total chromium, and were reported to two significant figures. Where chromium IV was not detected, the chromium III concentration was reported as the total chromium concentration at two significant figures.

Notes:
< - Result not detected above laboratory reporting limit.
CAS - Chemical Abstracts Service.
EPH - Extractable Petroleum Hydrocarbons.
FD - Field duplicate.
ft - feet.
J - Estimated value.
HPAH - High molecular weight PAH.
LPAH - Low molecular weight PAH.
mg/kg - milligram per kilogram.
N - Normal sample.
PAH - Polycyclic Aromatic Hydrocarbon.
PCB - Polychlorinated Biphenyl.
R - Rejected.
SVOC - Semivolatile organic compound.
TPH - Total Petroleum Hydrocarbon.
U - Not detected.
UJ - The analyte was not detected; and the reporting limit is approximate.
UR - Unreported/rejected.
VOC - Volatile organic compound.
VPH - Volatile Petroleum Hydrocarbons.
(a) Lab calculated value; only used when individual compound data not available.
(b) Total concentrations for use in the risk assessment were calculated per sample by summing only the detected individual compounds (i.e., Aroclor/PAH/xylene) concentrations. For samples without any detections of individual compounds (i.e., Aroclor/PAH/xylene), the maximum reporting detection limit within the sample is presented as a non-detect value. Calculated totals have a CAS number beginning with "RA-".
(c) Chromium III concentrations were calculated by the laboratory by subtracting chromium IV from total chromium, and were reported to two significant figures. Where chromium IV was not detected, the chromium III concentration was reported as the total chromium concentration at two significant figures.

Notes:
< - Result not detected above laboratory reporting limit.
CAS - Chemical Abstracts Service.
EPH - Extractable Petroleum Hydrocarbons.
FD - Field duplicate.
ft - feet.
J - Estimated value.
HPAH - High molecular weight PAH.
LPAH - Low molecular weight PAH.
mg/kg - milligram per kilogram.
N - Normal sample.
PAH - Polycyclic Aromatic Hydrocarbon.
PCB - Polychlorinated Biphenyl.
R - Rejected.
SVOC - Semivolatile organic compound.
TPH - Total Petroleum Hydrocarbon.
U - Not detected.
UJ - The analyte was not detected; and the reporting limit is approximate.
UR - Unreported/rejected.
VOC - Volatile organic compound.
VPH - Volatile Petroleum Hydrocarbons.
(a) Lab calculated value; only used when individual compound data not available.
(b) Total concentrations for use in the risk assessment were calculated per sample by summing only the detected individual compounds (i.e., Aroclor/PAH/xylene) concentrations. For samples without any detections of individual compounds (i.e., Aroclor/PAH/xylene), the maximum reporting detection limit within the sample is presented as a non-detect value. Calculated totals have a CAS number beginning with "RA-".
(c) Chromium III concentrations were calculated by the laboratory by subtracting chromium IV from total chromium, and were reported to two significant figures. Where chromium IV was not detected, the chromium III concentration was reported as the total chromium concentration at two significant figures.

Notes:
< - Result not detected above laboratory reporting limit.
CAS - Chemical Abstracts Service.
EPH - Extractable Petroleum Hydrocarbons.
FD - Field duplicate.
ft - feet.
J - Estimated value.
HPAH - High molecular weight PAH.
LPAH - Low molecular weight PAH.
mg/kg - milligram per kilogram.
N - Normal sample.
PAH - Polycyclic Aromatic Hydrocarbon.
PCB - Polychlorinated Biphenyl.
R - Rejected.
SVOC - Semivolatile organic compound.
TPH - Total Petroleum Hydrocarbon.
U - Not detected.
UJ - The analyte was not detected; and the reporting limit is approximate.
UR - Unreported/rejected.
VOC - Volatile organic compound.
VPH - Volatile Petroleum Hydrocarbons.
(a) Lab calculated value; only used when individual compound data not available.
(b) Total concentrations for use in the risk assessment were calculated per sample by summing only the detected individual compounds (i.e., Aroclor/PAH/xylene) concentrations. For samples without any detections of individual compounds (i.e., Aroclor/PAH/xylene), the maximum reporting detection limit within the sample is presented as a non-detect value. Calculated totals have a CAS number beginning with "RA-".
(c) Chromium III concentrations were calculated by the laboratory by subtracting chromium IV from total chromium, and were reported to two significant figures. Where chromium IV was not detected, the chromium III concentration was reported as the total chromium concentration at two significant figures.

Notes:
< - Result not detected above laboratory reporting limit.
CAS - Chemical Abstracts Service.
EPH - Extractable Petroleum Hydrocarbons.
FD - Field duplicate.
ft - feet.
J - Estimated value.
HPAH - High molecular weight PAH.
LPAH - Low molecular weight PAH.
mg/kg - milligram per kilogram.
N - Normal sample.
PAH - Polycyclic Aromatic Hydrocarbon.
PCB - Polychlorinated Biphenyl.
R - Rejected.
SVOC - Semivolatile organic compound.
TPH - Total Petroleum Hydrocarbon.
U - Not detected.
UJ - The analyte was not detected; and the reporting limit is approximate.
UR - Unreported/rejected.
VOC - Volatile organic compound.
VPH - Volatile Petroleum Hydrocarbons.
(a) Lab calculated value; only used when individual compound data not available.
(b) Total concentrations for use in the risk assessment were calculated per sample by summing only the detected individual compounds (i.e., Aroclor/PAH/xylene) concentrations. For samples without any detections of individual compounds (i.e., Aroclor/PAH/xylene), the maximum reporting detection limit within the sample is presented as a non-detect value. Calculated totals have a CAS number beginning with "RA-".
(c) Chromium III concentrations were calculated by the laboratory by subtracting chromium IV from total chromium, and were reported to two significant figures. Where chromium IV was not detected, the chromium III concentration was reported as the total chromium concentration at two significant figures.

Notes:
< - Result not detected above laboratory reporting limit.
CAS - Chemical Abstracts Service.
EPH - Extractable Petroleum Hydrocarbons.
FD - Field duplicate.
ft - feet.
J - Estimated value.
HPAH - High molecular weight PAH.
LPAH - Low molecular weight PAH.
mg/kg - milligram per kilogram.
N - Normal sample.
PAH - Polycyclic Aromatic Hydrocarbon.
PCB - Polychlorinated Biphenyl.
R - Rejected.
SVOC - Semivolatile organic compound.
TPH - Total Petroleum Hydrocarbon.
U - Not detected.
UJ - The analyte was not detected; and the reporting limit is approximate.
UR - Unreqeed/rejected.
VOC - Volatile organic compound.
VPH - Volatile Petroleum Hydrocarbons.
(a) Lab calculated value; only used when individual compound data not available.
(b) Total concentrations for use in the risk assessment were calculated per sample by summing only the detected individual compounds (i.e., Aroclor/PAH/xylene) concentrations. For samples without any detections of individual compounds (i.e., Aroclor/PAH/xylene), the maximum reporting detection limit within the sample is presented as a non-detect value. Calculated totals have a CAS number beginning with "RA-".
(c) Chromium III concentrations were calculated by the laboratory by subtracting chromium IV from total chromium, and were reported to two significant figures. Where chromium IV was not detected, the chromium III concentration was reported as the total chromium concentration at two significant figures.

Notes:
< - Result not detected above laboratory reporting limit.
CAS - Chemical Abstracts Service.
EPH - Extractable Petroleum Hydrocarbons.
FD - Field duplicate.
ft - feet.
J - Estimated value.
HPAH - High molecular weight PAH.
LPAH - Low molecular weight PAH.
mg/kg - milligram per kilogram.
N - Normal sample.
PAH - Polycyclic Aromatic Hydrocarbon.
PCB - Polychlorinated Biphenyl.
R - Rejected.
SVOC - Semivolatile organic compound.
TPH - Total Petroleum Hydrocarbon.
U - Not detected.
UJ - The analyte was not detected; and the reporting limit is approximate.
UR - Unreported/rejected.
VOC - Volatile organic compound.
VPH - Volatile Petroleum Hydrocarbons.
(a) Lab calculated value; only used when individual compound data not available.
(b) Total concentrations for use in the risk assessment were calculated per sample by summing only the detected individual compounds (i.e., Aroclor/PAH/xylene) concentrations. For samples without any detections of individual compounds (i.e., Aroclor/PAH/xylene), the maximum reporting detection limit within the sample is presented as a non-detect value. Calculated totals have a CAS number beginning with "RA-".
(c) Chromium III concentrations were calculated by the laboratory by subtracting chromium IV from total chromium, and were reported to two significant figures. Where chromium IV was not detected, the chromium III concentration was reported as the total chromium concentration at two significant figures.

Notes:
< - Result not detected above laboratory reporting limit.
CAS - Chemical Abstracts Service.
EPH - Extractable Petroleum Hydrocarbons.
FD - Field duplicate.
ft - feet.
J - Estimated value.
HPAH - High molecular weight PAH.
LPAH - Low molecular weight PAH.
mg/kg - milligram per kilogram.
N - Normal sample.
PAH - Polycyclic Aromatic Hydrocarbon.
PCB - Polychlorinated Biphenyl.
R - Rejected.
SVOC - Semivolatile organic compound.
TPH - Total Petroleum Hydrocarbon.
U - Not detected.
UJ - The analyte was not detected; and the reporting limit is approximate.
UR - Unreported/rejected.
VOC - Volatile organic compound.
VPH - Volatile Petroleum Hydrocarbons.
(a) Lab calculated value; only used when individual compound data not available.
(b) Total concentrations for use in the risk assessment were calculated per sample by summing only the detected individual compounds (i.e., Aroclor/PAH/xylene) concentrations. For samples without any detections of individual compounds (i.e., Aroclor/PAH/xylene), the maximum reporting detection limit within the sample is presented as a non-detect value. Calculated totals have a CAS number beginning with "RA-".
(c) Chromium III concentrations were calculated by the laboratory by subtracting chromium IV from total chromium, and were reported to two significant figures. Where chromium IV was not detected, the chromium III concentration was reported as the total chromium concentration at two significant figures.

Notes:
< - Result not detected above laboratory reporting limit.
CAS - Chemical Abstracts Service.
EPH - Extractable Petroleum Hydrocarbons.
FD - Field duplicate.
ft - feet.
J - Estimated value.
HPAH - High molecular weight PAH.
LPAH - Low molecular weight PAH.
mg/kg - milligram per kilogram.
N - Normal sample.
PAH - Polycyclic Aromatic Hydrocarbon.
PCB - Polychlorinated Biphenyl.
R - Rejected.
SVOC - Semivolatile organic compound.
TPH - Total Petroleum Hydrocarbon.
U - Not detected.
UJ - The analyte was not detected; and the reporting limit is approximate.
UR - Unreported/rejected.
VOC - Volatile organic compound.
VPH - Volatile Petroleum Hydrocarbons.
(a) Lab calculated value; only used when individual compound data not available.
(b) Total concentrations for use in the risk assessment were calculated per sample by summing only the detected individual compounds (i.e., Aroclor/PAH/xylene) concentrations. For samples without any detections of individual compounds (i.e., Aroclor/PAH/xylene), the maximum reporting detection limit within the sample is presented as a non-detect value. Calculated totals have a CAS number beginning with "RA-".
(c) Chromium III concentrations were calculated by the laboratory by subtracting chromium IV from total chromium, and were reported to two significant figures. Where chromium IV was not detected, the chromium III concentration was reported as the total chromium concentration at two significant figures.

Notes:
< - Result not detected above laboratory reporting limit.
CAS - Chemical Abstracts Service.
FD - Field duplicate.
ft - feet.
J - Estimated value.
HPAH - High molecular weight PAH.
LPAH - Low molecular weight PAH.
mg/kg - milligram per kilogram.
N - Normal sample.
PAH - Polycyclic Aromatic Hydrocarbon.
PCB - Polychlorinated Biphenyl.
SVOC - Semivolatile organic compound.
TPH - Total Petroleum Hydrocarbon.
U - Not detected.
UJ - The analyte was not detected; and the reporting limit is approximate.
UR - Unreported/rejected.
VOC - Volatile organic compound.
VPH - Volatile Petroleum Hydrocarbons.
(a) Lab calculated value; only used when individual compound data not available.
(b) Total concentrations for use in the risk assessment were calculated per sample by summing only the detected individual compounds (i.e., Aroclor/PAH/xylene) concentrations. For samples without any detections of individual compounds (i.e., Aroclor/PAH/xylene), the maximum reporting detection limit within the sample is presented as a non-detect value. Calculated totals have a CAS number beginning with "RA-".
(c) Chromium III concentrations were calculated by the laboratory by subtracting chromium IV from total chromium, and were reported to two significant figures. Where chromium IV was not detected, the chromium III concentration was reported as the total chromium concentration at two significant figures.

Notes:
< - Result not detected above laboratory reporting limit.
CAS - Chemical Abstracts Service.
FD - Field duplicate.
ft - feet.
J - Estimated value.
HPAH - High molecular weight PAH.
LPAH - Low molecular weight PAH.
mg/kg - milligram per kilogram.
N - Normal sample.
PAH - Polycyclic Aromatic Hydrocarbon.
PCB - Polychlorinated Biphenyl.
SVOC - Semivolatile organic compound.
TPH - Total Petroleum Hydrocarbon.
U - Not detected.
UJ - The analyte was not detected; and the reporting limit is approximate.
UR - Unreported/rejected.
VOC - Volatile organic compound.
VPH - Volatile Petroleum Hydrocarbons.
(a) Lab calculated value; only used when individual compound data not available.
(b) Total concentrations for use in the risk assessment were calculated per sample by summing only the detected individual compounds (i.e., Aroclor/PAH/xylene) concentrations. For samples without any detections of individual compounds (i.e., Aroclor/PAH/xylene), the maximum reporting detection limit within the sample is presented as a non-detect value. Calculated totals have a CAS number beginning with "RA-".
(c) Chromium III concentrations were calculated by the laboratory by subtracting chromium IV from total chromium, and were reported to two significant figures. Where chromium IV was not detected, the chromium III concentration was reported as the total chromium concentration at two significant figures.

Notes:
< - Result not detected above laboratory reporting limit.
CAS - Chemical Abstracts Service.
F - Filtered sample.
FD - Field duplicate.
J - Estimated value.
HPAH - High molecular weight PAH.
LPAH - Low molecular weight PAH.
N - Normal sample.
PAH - Polycyclic Aromatic Hydrocarbon.
PCB - Polychlorinated Biphenyl.
SVOC - Semivolatile organic compound.
TPH - Total Petroleum Hydrocarbon.
ug/L - microgram per liter.
U - Not detected.
UJ - The analyte was not detected; and the reporting limit is approximate.
UR - Unreported/rejected.
VOC - Volatile organic compound.
VPH - Volatile Petroleum Hydrocarbons.
(a) Lab calculated value; only used when individual compound data not available.
(b) Total concentrations for use in the risk assessment were calculated per sample by summing only the detected individual compounds (i.e., Aroclor/PAH/xylene) concentrations. For samples without any detections of individual compounds (i.e., Aroclor/PAH/xylene), the maximum reporting detection limit within the sample is presented as a non-detect value. Calculated totals have a CAS number beginning with "RA-".

Notes:
< - Result not detected above laboratory reporting limit.
CAS - Chemical Abstracts Service.
F - Filtered sample.
FD - Field duplicate.
J - Estimated value.
HPAH - High molecular weight PAH.
LPAH - Low molecular weight PAH.
N - Normal sample.
PAH - Polycyclic Aromatic Hydrocarbon.
PCB - Polychlorinated Biphenyl.
SVOC - Semivolatile organic compound.
TPH - Total Petroleum Hydrocarbon.
ug/L - microgram per liter.
U - Not detected.
UJ - The analyte was not detected; and the reporting limit is approximate.
UR - Unreported/rejected.
VOC - Volatile organic compound.
VPH - Volatile Petroleum Hydrocarbons.
(a) Lab calculated value; only used when individual compound data not available.
(b) Total concentrations for use in the risk assessment were calculated per sample by summing only the detected individual compounds (i.e., Aroclor/PAH/xylene) concentrations. For samples without any detections of individual compounds (i.e., Aroclor/PAH/xylene), the maximum reporting detection limit within the sample is presented as a non-detect value. Calculated totals have a CAS number beginning with "RA-".

Notes:
The calculation of the summary statistics is based on detected concentrations only. The minimum and maximum detection limits are presented for chemicals that were not detected.
All results reported in milligrams per kilogram (mg/kg) unless otherwise noted.
FOD - Frequency of Detection.
J - The compound was positively identified; however, the associated numerical value is an estimated concentration only.
ND - Not Detected.
[1] Chemical analyzed using extractable petroleum hydrocarbon (EPH) methods.

Notes:
The calculation of the summary statistics is based on detected concentrations only. The minimum and maximum detection limits are presented for chemicals that were not detected.
All results reported in milligrams per kilogram (mg/kg) unless otherwise noted.
FOD - Frequency of Detection.
J - The compound was positively identified; however, the associated numerical value is an estimated concentration only.
ND - Not Detected.

SUMMARY OF REPRESENTATIVE WILDLIFE RECEPTORS SELECTED FOR EVALUATION IN THE ECOLOGICAL RISK ASSESSMENT
ECOLOGICAL RISK ASSESSMENT
FIRE TRAINING AREA, NCTAMS LANT DET CUTLER

It is not feasible to evaluate exposures and risks for each of the vertebrate wildlife species potentially present in the vicinity of the Fire Training Area (FTA) located at the Naval Computer and Telecommunications Area Master Station Atlantic Detachment (NCTAMS LANT Det) in Cutler, Maine. Therefore, representative wildlife species were identified as surrogates in order to estimate exposure and risk. The surrogate species are wildlife species that are representative of species with similar dietary preferences that may be present within the ecological exposure areas to be evaluated in the ERA. Representative surrogate species were selected based on a review of trophic level, feeding habits, and the availability of life history information. Species-specific exposure assumptions are provided in the food web model appendices for each of the exposure areas and in **Table 1** of this attachment.

In order to evaluate potential bioaccumulation in the food chain, two trophic levels were selected for evaluation. These trophic levels include Trophic Level 2 (TL2) herbivores, and Trophic Level 3 (TL3) insectivores. Herbivores are primary consumers, ingesting primary producers (vegetation) and analytes from one trophic level. Insectivores consume primary consumers (invertebrates).

Trophic Level 4 (TL4) carnivorous birds and mammals were not selected for evaluation in the ERA because their home ranges (hundreds of acres) are much larger than the site so they would only consume a small portion of food from the site. Because of that, risks will be greater to small mammals and birds that may obtain all of the food from contaminated areas around the site.

The following individual species were identified as representative surrogate species for the food web model.

Meadow vole *(Microtus pennsylvanicus)*: The meadow vole was selected as a representative mammalian herbivore wildlife species for evaluation of potential risks associated with the terrestrial exposure area. The meadow vole is common in the United States and is associated with a wide range of habitats including wetlands and rangelands. Meadow voles inhabit grassy fields, marshes, and bogs; however, they prefer fields with more grass, more cover, and fewer woody plants. They typically consume green succulent vegetation, sedges, seeds, roots, bark, fungi, insects, and animal matter. However, green succulent vegetation makes up the majority of their diet (USEPA, 1993). Home range of the meadow vole listed by USEPA (1993) ranges from 0.000494 to 0.2051 acres with an average of 0.0659 acres. Selection of the meadow vole allows evaluation of a TL2 herbivorous exposure pathway in the terrestrial habitat available at the FTA.

Short-tailed shrew (*Blarina brevicauda*): The short-tailed shrew was selected as a representative small insectivorous mammalian wildlife species that may be found within the terrestrial exposure area. Insects, earthworms, slugs, and snails can make up most of the shrew's food, while plants, fungi, millipedes, centipedes, arachnids, and small mammals also are consumed. Shrews inhabit a wide variety of habitats and are common in areas with abundant vegetative cover. They need cool, moist habitats because of their high metabolic and water-loss rates (USEPA, 1993). The mean home range of the short-tailed shrew listed by USEPA (1993) is 0.96 acres. Selection of the short-tailed shrew allows evaluation of a TL3 insectivorous exposure pathway in the terrestrial habitat available at the FTA.

Raccoon (*Procyon lotor*): The raccoon was selected as a representative insectivorous mammalian wildlife species that may be found within the wetland exposure areas. It is assumed that the raccoon consumes benthic invertebrates associated with the wetland portions of the FTA. The raccoon is the most abundant and widespread medium-sized omnivore in North America. Raccoons are commonly found in aquatic habitats, particularly in hardwood swamps, floodplain forests and freshwater and saltwater marshes. They are also common in suburban residential areas. Raccoons feed primarily on fleshy fruits, nuts, acorns, and corn, but also eat grains, insects, frogs, crayfish, eggs, and virtually any

animal and vegetable matter, with plants typically being an important component of the diet. The proportion of different foods in their diet depends on location and season and they may focus on a preferred food when it is available (USEPA, 1993). Raccoons have a large home range; the home range areas listed by USEPA (1993) ranges from 96 to 6325 acres with an average of 1558 acres. Selection of the raccoon allows evaluation of a TL3 insectivorous exposure pathway for the wetland habitat available at the FTA.

Bobwhite quail (*Colinus virginianus*): The bobwhite quail was selected as a representative herbivorous avian wildlife species for the terrestrial exposure area. Quail are ground-dwelling birds adapted for foraging on the ground for seeds and insects. Bobwhite quail are the most widespread of the North American quail. They prefer to forage in areas with open vegetation, some bare ground, and light litter. Home range areas for the quail range from 8.9 to 41.3 acres with an average of 24.7 acres (USEPA, 1993). Seeds from weeds, woody plants, and grasses comprise the majority of an adult's diet, although green vegetation may also be consumed. Insects and other invertebrates can comprise up to 10 to 25 percent of the adults' diet during the spring and summer in more northerly areas. Bobwhite quail are typically not migratory (USEPA, 1993). Selection of the bobwhite quail allows evaluation of a TL2 herbivorous exposure pathway in the terrestrial habitat available at the FTA.

American robin *(Turdus migratorius)*: The robin was selected as a representative insectivorous avian wildlife species for the terrestrial exposure area. The robin occurs throughout most of the continental United States and can be found in a variety of habitats including open woodlands, swamps, suburbs, parks, lawns, moist forests, and orchards. Access to fresh water, protected nesting sites and productive foraging areas are important requirements. Robins forage on the ground in open areas, along habitat edges or the edges of streams as well as above ground in shrubs and lower branches of trees. Home range areas of the robin have been reported from 0.27 to 1.04 acres with an average of 0.6095 acres (USEPA, 1993). In the months preceding and during the breeding season, robins feed primarily on invertebrates and on some fruits. During the rest of the year their diet consists primarily of fruits. Most northern robins leave their breeding grounds from September to November and return between February and April (USEPA, 1993). Selection of the robin allows evaluation of a TL3 insectivorous exposure pathway in the terrestrial habitat available at the FTA.

Marsh wren (*Cistothorus palustris*): The marsh wren was selected as a representative insectivorous avian wildlife species for the freshwater exposure area. These birds commonly inhabit freshwater cattail marshes and salt marshes and have long, slender bills adapted for gleaning insects from the ground and vegetation. Permanent water is necessary to provide a food supply of insects necessary to maintain the birds and as a defense against predation (USEPA, 1993). Therefore, wrens are expected to be migratory in areas where marshes freeze. Marsh wrens consume aquatic invertebrates, other insects, and spiders, which they typically glean from the water surface, on stems and leaves of emergent vegetation, and the marsh floor. The insect orders most commonly taken include Coleoptera, Diptera, Hemiptera, Lepidoptera, and Odonata. Home range areas for the marsh wren have been reported from 0.17 to 0.42 acres with an average of 0.295 acres (USEPA, 1993). Selection of the marsh wren allows evaluation of a TL3 insectivorous exposure pathway for the wetland habitat available at the FTA.

General Notes:
See individual organism notes for source, units, and conversion.
All receptors assumed to be present and actively foraging year-round in screening level evaluation (area use factor [AUF] and exposure duration [ED] set at 100%).

BW - Body Weight.
DW - Dry Weight.
FIR - Food Ingestion Rate.
Kg - Kilogram.
L/day - Liters per Day.

Notes for Bobwhite quail
[a] Average of adult body weights listed by USEPA (1993).
[b] Average food ingestion rate of 0.078 g/g/day (USEPA, 1993) multiplied by average body weight of 0.1751 kg (USEPA, 1993) and 0.15 to convert to dry weight (grass ingestion).
[c] An exclusive terrestrial plant diet was selected.
[d] The incidental soil ingestion rate is based on 50th percentile value for mourning dove (USEPA, 2007a).
[e] Water ingestion rate of 0.13 L/day (USEPA, 1993) multiplied by average body weight.

Notes for American robin
[a] Average of adult body weights listed by USEPA (1993).
[b] Food ingestion rates were calculated from Nagy et al. (1999) for insectivorous birds as follows:
FIR (kJ/day)= (9.7*BW(g) $^{0.705}$) using average body weight of 0.0804 kg (USEPA, 1993). FIR is converted to kg/day by dividing by 18 kJ/g of dry matter for avian insectivores (Nagy et al., 1999) and then dividing by 1000.
[c] An exclusive soil invertebrate diet was selected.
[d] In the absence of data for the robin, the incidental soil ingestion rate is based on 50th percentile value for woodcock (USEPA, 2007a).
[e] Water ingestion rate of 0.14 L/day (USEPA, 1993) multiplied by average body weight.

ATTACHMENT C TABLE 1
EXPOSURE PARAMETERS FOR WILDLIFE RECEPTORS
ECOLOGICAL RISK ASSESSMENT
FIRE TRAINING AREA, NCTAMS LANT DET CUTLER
CUTLER, MAINE

Notes for Marsh Wren
[a] Average of adult body weights listed by USEPA (1993).
[b] Food ingestion rate calculated using algorithm for insectivorous birds developed by Nagy, 2001 [FIR (g_{dw}/day) = 0.540*$BW^{0.705}$] using average body weight.
[c] An exclusive diet was selected. Benthic invertebrates assumed to represent most relevant dietary exposure for the site.
[d] In the absence of data for the wren, the incidental soil ingestion rate is based on the mallard based on dietary similarities (USACHPPM, 2004).
[e] Water ingestion rate calculated using algorithm for all birds developed by Calder and Braun, 1983 [WIR (kg/day) = 0.059*$BW^{0.67}$] using average body weight.

Notes for Meadow vole
[a] Average of adult body weights listed by USEPA (1993).
[b] Average food ingestion rate of 0.33 g/g/day (USEPA, 1993) multiplied by average body weight of 0.0358 kg (USEPA, 1993) and 0.15 to convert to dry weight (grass ingestion).
[c] An exclusive terrestrial plant diet was selected.
[d] The incidental soil ingestion rate is based on 50th percentile value for vole (USEPA, 2007a).
[e] Maximum water ingestion rate of 0.21 L/day (USEPA, 1993) multiplied by average body weight.

Notes for Short-tailed shrew
[a] Average of adult body weights listed by USEPA (1993).
[b] Average food ingestion rate of 0.555 g/g/day (USEPA, 1993) multiplied by average body weight of 0.0161 kg (USEPA, 1993) and 0.16 to convert to dry weight (earthworm ingestion)
[c] An exclusive soil invertebrate diet was selected.
[d] The incidental soil ingestion rate is based on 50th percentile value for shrew (USEPA, 2007a).
[e] Water ingestion rate of 0.223 L/day (USEPA, 1993) multiplied by average body weight.

Notes for Raccoon
[a] Average of adult body weights listed by USEPA (1993; value is average of the average values from three studies).

[b] Food ingestion rate calculated using algorithm for carnivores developed by Nagy, et al. (1999) as follows:
FIR (kJ/day)= (2.23*BW(g) $^{0.85}$) using average body weight of 5.636 kg (USEPA, 1993). FIR is converted to kg/day by dividing by 18.7 kJ/g of dry matter for mammalian insectivores (Nagy et al., 1999) and then dividing by 1000.
[c] An exclusive diet was selected. Benthic invertebrates assumed to represent most relevant dietary exposure for the site.
[d] The incidental soil ingestion rate is based on the value identified by Beyer (1994) for raccoons.
[e] Water ingestion rate calculated using algorithm for all mammals developed by Calder and Braun, 1983 [WIR (kg/day) = 0.099*$BW^{0.90}$] using average body weight.

Phenanthrene	0.4		USEPA R3	13	(a,d)	ORNL SAV
VOLATILE ORGANIC COMPOUNDS						
Acetone	1500	(a)	USEPA R3	28000	(a)	ORNL SAV
Toluene	2		USEPA R3	120	(a)	ORNL SAV
POLYCHLORINATED BIPHENYLs						
Total PCBs	0.014		USEPA AWQC	NA		

Notes:
All screening values reported in micrograms per liter (ug/L).
AWQC - Ambient Water Quality Criteria (USEPA, 2009).
NA - Not available/applicable.
ORNL SAV - Oak Ridge National Laboratory Secondary Acute Value (Suter and Tsao, 1996).
PCB - Polychlorinated Biphenyl.
SAV - Secondary Acute Value.
USEPA - United States Environmental Protection Agency.
USEPA R3 - USEPA Region 3 freshwater screening values (USEPA, 2006b).
USEPA R4 - EPA Region 4 recommended ecological screening values for surface water (USEPA, 2015).
USEPA R5 - USEPA Region 5 ecological screening levels for surface water (USEPA, 2003).

(a) Value is for dissolved phase.
(b) Applies to waters with pH between 6.5 and 9.
(c) Value for benzo(a)pyrene used as a surrogate due to structural similarities (high molecular weight polycyclic aromatic hydrocarbons).
(d) Value is hardness dependant. The site specific average hardness of 111 mg/L $CaCO_3$ was used.
(e) Acute AWQC is equal to 1/[(f1/CMC1) + (f2/CMC2)] where f1 and f2 are the fractions of total selenium that are treated as selenite and selenate, respectively, and CMC1 and CMC2 are 185.9 ug/L and 12.82 ug/L, respectively. A consevative assumption of 100% selenate has been made.

Silver	6.02	118.6	2.02	60.47
Zinc	75.4	298	66.1	171
SEMI VOLATILE ORGANIC COMPOUNDS				
Total HMW PAHs	0.615	38.4	2	20
Total LMW PAHs	65.6	356	2	20
PESTICIDES				
4,4-DDD	0.147	5.56	0.227	2.7
4,4-DDE	0.147	5.56	0.227	2.7
4,4-DDT	0.147	5.56	0.227	2.7
Aldrin	0.2	1	0.0709	0.87
Dieldrin	0.015	1.27	0.0709	0.87
Endosulfan I	0.15	1.5	10	100
Endosulfan II	0.15	1.5	10	100
Endosulfan Sulfate	0.15	1.5	10	100
Endrin	0.092	0.92	NV	NV
Endrin Aldehyde	0.92	0.92	0.01035	0.1035
Endrin Ketone	0.92	0.92	0.01035	0.1035
Heptachlor epoxide	0.1	1	NV	NV
Methoxychlor	4	8	25.78	258
POLYCHLORINATED BIPHENYLs				
Total PCBs	0.068	0.68	0.18	1.8

Notes:
NV - No value identified.
HMW - High Molecular Weight.
LMW - Low Molecular Weight.
LOAEL - Lowest Observed Adverse Effects Level.
NOAEL - No Observed Adverse Effects Level.
PAH - Polycyclic Aromatic Hydrocarbon.
PCB - Polychlorinated Biphenyl.
TRV - Toxicity Reference Value.
The sources of these NOAELs and LOAELs are presented in Table D-5.

The NOAELs and LOAELs in Table D-5 were divided by 10 if a subchronic study was the basis for the value.
NOAELs were estimated if a NOAEL was not identified in the literature. The LOAEL was divided by 10 to derive an estimated NOAEL.
LOAELs were estimated if a LOAEL was not identified in the literature. The NOAEL was multiplied by 10 to derive an estimated LOAEL.
For methoxychlor, LANL (2016) applied an uncertainty factor of 0.01 to extrapolate an acute NOAEL to a chronic NOAEL.

4,4'-DDT used as a surrogate for 4,4'-DDD and 4,4'-DDE.
Dieldrin used as a surrogate for aldrin for birds.
Endosulfan used as a surrogate for endosulfan I and II and endosulfan sulfate.
Endrin used as a surrogate for endrin aldehyde and endrin ketone.
Heptachlor used as a surrogate for heptachlor epoxide.
7,12-Dimethylbenz(a)anthracene used as a surrogate for PAHs for birds.
Aroclor 1254 used as a surrogate for Total PCBs.

ATTACHMENT E TABLE 1
EXPOSURE PARAMETERS FOR ECOLOGICAL RECEPTORS IN TERRESTRIAL EXPOSURE AREA
ECOLOGICAL RISK ASSESSMENT
FIRE TRAINING AREA, NCTAMS LANT DET CUTLER
CUTLER, MAINE

Receptor Species	Average Body Weight (kg)	Food Ingestion Rate (kg_{dw}/day)	Dietary Assumptions for Use in SRA (%; kg_{dw}/day)		Incidental Soil/Sediment Ingestion (%; kg_{dw}/day)	Water Ingestion Rate (L/day)
			Terrestrial Plants	Soil Invertebrates		
Birds						
Bobwhite quail *(Colinus virginianus)*	0.1751 [a]	0.00204 [b]	100% [c] 0.00204	--	6.1% [d] 0.00012	0.0228 [e]
American robin *(Turdus migratorius)*	0.0804 [a]	0.0119 [b]	--	100% [c] 0.0119	6.4% [d] 0.00076	0.0113 [e]
Mammals						
Meadow vole *(Microtus pennsylvanicus)*	0.0358 [a]	0.00174 [b]	100% [c] 0.00174	--	1.2% [d] 0.000021	0.0075 [e]
Short-tailed shrew *(Blarina brevicauda)*	0.0161 [a]	0.00143 [b]	--	100% [c] 0.0014	0.90% [d] 0.000013	0.0036 [e]

General Notes:

See individual organism notes for source, units, and conversion.

All receptors assumed to be present and actively foraging year-round in screening level evaluation (area use factor [AUF] and exposure duration [ED] set at 100%).

BW - Body Weight.

DW - Dry Weight.

FIR - Food Ingestion Rate.

SRA - Screening Risk Assessment.

Notes for Bobwhite quail
[a] Average of adult body weights listed by USEPA (1993).
[b] Average food ingestion rate of 0.078 g/g/day (USEPA, 1993) multiplied by average body weight of 0.1751 kg (USEPA, 1993) and 0.15 to convert to dry weight (grass ingestion).
[c] An exclusive terrestrial plant diet was selected.
[d] The incidental soil ingestion rate is based on 50th percentile value for mourning dove (USEPA, 2007a).
[e] Water ingestion rate of 0.13 L/day (USEPA, 1993) multiplied by average body weight.

Notes for American robin
[a] Average of adult body weights listed by USEPA (1993).
[b] Food ingestion rates were calculated from Nagy et al. (1999) for insectivorous birds as follows:
FIR (kJ/day)= (9.7*BW(g) $^{0.705}$) using average body weight of 0.0804 kg (USEPA, 1993). FIR is converted to kg/day by dividing by 18 kJ/g of dry matter for avian insectivores (Nagy et al., 1999) and then dividing by 1000.
[c] An exclusive soil invertebrate diet was selected.
[d] In the absence of data for the robin, the incidental soil ingestion rate is based on 50th percentile value for woodcock (USEPA, 2007a).
[e] Water ingestion rate of 0.14 L/day (USEPA, 1993) multiplied by average body weight.

Notes for Meadow vole
[a] Average of adult body weights listed by USEPA (1993).
[b] Average food ingestion rate of 0.33 g/g/day (USEPA, 1993) multiplied by average body weight of 0.0358 kg (USEPA, 1993) and 0.15 to convert to dry weight (grass ingestion).
[c] An exclusive terrestrial plant diet was selected.
[d] The incidental soil ingestion rate is based on 50th percentile value for vole (USEPA, 2007a).
[e] Maximum water ingestion rate of 0.21 L/day (USEPA, 1993) multiplied by average body weight.

Notes for Short-tailed shrew
[a] Average of adult body weights listed by USEPA (1993).
[b] Average food ingestion rate of 0.555 g/g/day (USEPA, 1993) multiplied by average body weight of 0.0161 kg (USEPA, 1993) and 0.16 to convert to dry weight (earthworm ingestion).
[c] An exclusive soil invertebrate diet was selected.
[d] The incidental soil ingestion rate is based on 50th percentile value for shrew (USEPA, 2007a).
[e] Water ingestion rate of 0.223 L/day (USEPA, 1993) multiplied by average body weight.

Notes:
Maximum EPCs for screening level evaluation represent maximum detected concentrations. Moisture content assumed to be 84% for soil invertebrates (USEPA, 1993).
Unless otherwise noted, uptake factors derive tissue concentrations on a dry weight basis.

COPC - Chemical of Potential Concern.
dw - Dry Weight.
EPC - Exposure Point Concentration.
HMW - High Molecular Weight.
LMW - Low Molecular Weight.
NA - Not Analyzed
ND - Not Detected.
PAHs - Polycyclic Aromatic Hydrocarbons.
PCBs - Polychlorinated Biphenyls.
USEPA - United States Environmental Protection Agency.

CUTLER, MAINE

[a] Media summary statistics presented in Attachment B of the Ecological Risk Assessment appendix.

[b] Site-specific soil-to-worm regression equation derived for the Very Low Frequency (VLF) Peninsula (Resolution, 2015) adjusted to present dry weight tissue concentration assuming 84% moisture.

cadmium	tissue concentration = [9.235 * (soil concentration) + 1.801]/(1-% moisture)]
chromium	tissue concentration = [0.3008 * (soil concentration) - 2.1796]/(1-% moisture)]
lead	tissue concentration = [0.7107 * (soil concentration) - 18.466]/(1-% moisture)]
selenium	tissue concentration = [8.07 * (soil concentration) + 1.762]/(1-% moisture)]
zinc	tissue concentration = [1.6262 * (soil concentration) + 202.26]/(1-% moisture)]
Total PCBs	tissue concentration = [0.3967 * (soil concentration) + 0.0536]/(1-% moisture)]

[c] Soil-to-invertebrate uptake factors and regression equations recommended by USEPA in development of Ecological Soil Screening Levels (USEPA, 2007a)

arsenic	ln(tissue concentration) = 0.706 * ln(soil concentration) - 1.421
4,4-DDD	ln(tissue concentration) = 0.69754 * ln(soil concentration) + 1.1613
4,4-DDT	ln(tissue concentration) = 0.8689 * ln(soil concentration) + 2.1247

[d] Soil-to-earthworm uptake factors from Sample, et al (1998) - median value from Table 11.

[e] Soil to invertebrate transfer factors from the LANL Ecorisk Database (Release 3.3) (LANL, 2015). Heptachlor values based on laboratory study; others values calculated based on Kd and Kow assuming 1% organic carbon in soil.

[f] Soil-to-plant uptake factors and regression equations recommended by USEPA in development of Ecological Soil Screening Levels (USEPA, 2007a)

cadmium	ln(tissue concentration) = 0.546 * ln(soil concentration) - 0.475
copper	ln(tissue concentration) = 0.394 * ln(soil concentration) + 0.668
lead	ln(tissue concentration) = 0.561 * ln(soil concentration) - 1.328
nickel	ln(tissue concentration) = 0.748 * ln(soil concentration) - 2.223
selenium	ln(tissue concentration) = 1.104 * ln(soil concentration) - 0.677
zinc	ln(tissue concentration) = 0.554 * ln(soil concentration) + 1.575
Total LMW PAHs	ln(tissue concentration) = 0.4544 * ln(soil concentration) - 1.3205
Total HMW PAHs	ln(tissue concentration) = 0.9469 * ln(soil concentration) - 1.7026

[g] Values identified using the Risk Assessment Information System (http://rais.ornl.gov/cgi-bin/tools/TOX_search?select=chem_spef; accessed September 13, 2016).

[h] Value for Aroclor 1254 used for Total PCBs.

[i] Value for endosulfan used as a surrogate due to structural similarity.

[j] Value for endrin used as a surrogate due to structural similarity.

[k] Soil-to-plant uptake factors from Bechtel Jacobs (1998) - median value from Table 6.

[l] Value for heptachlor used as a surrogate due to structural similarity.

Notes:
Avian TRVs are not available for heptachlor
NOAELs were estimated if a NOAEL was not identified in the literature. The LOAEL was divided by 10 to derive an estimated NOAEL.
LOAELs were estimated if a LOAEL was not identified in the literature. The NOAEL was multiplied by 10 to derive an estimated LOAEL.
LOAEL values from USEPA Eco-SSL documents were calculated as the geometric mean of growth and reproduction LOAEL values.
Additional LOAELs were identified in Sample et al (1996) and in other literature sources used to identify the NOAEL-based TRVs.

COPC - Chemical of Potential Concern.
HMW - High Molecular Weight.
LMW - Low Molecular Weight.
LOAEL - Lowest Observed Adverse Effects Level.
NOAEL - No Observed Adverse Effects Level.
PAHs - Polycyclic Aromatic Hydrocarbons.
PCBs - Polychlorinated Biphenyls.
TRV - Toxicological Reference Value

[a] 7,12-Dimethylbenz(a)anthracene used as a surrogate for PAHs.
[b] 4,4'-DDT used as a surrogate for 4,4'-DDD.
[c] Dieldrin used as a surrogate for aldrin.
[d] Endosulfan used as a surrogate for endosulfan I, endosulfan II and endosulfan sulfate.
[e] Endrin used as a surrogate for endrin aldehyde and endrin ketone.
[f] Heptachlor used as a surrogate for heptachlor epoxide.
[g] Aroclor 1254 used as a surrogate for Total PCBs.

Soil Consumption Rate (kg_{dw}/day)	0.00012
Water Consumption Rate (kg/day)	0.0228
Terrestrial Plant Consumption Rate (kg_{dw}/day)	0.0020

$$\text{Total Daily Dose} = \frac{\Sigma([IR_f \times C_f] + [IR_s \times C_s] + [IR_w \times C_w] \times ED \times AUF}{\text{Average Body Weight (kg)}}$$

Where:
IR_f = Ingestion rate of food (kg/day)
IR_s = Incidental ingestion rate of sediment or soil (kg/day)
IR_w = Drinking water ingestion rate(L/day)
C_f = Concentration of COPC in food (mg/kg)
C_s= Concentration of COPC in sediment or soil (mg/kg)
C_w= Concentration of COPC in water(mg/L)
ED = Exposure duration (fraction of time receptor spends within exposure area)
AUF = Area use factor (ratio of the receptor's home range relative to the size of exposure area)

Notes:
COPC - Chemical of Potential Concern.
dw - Dry Weight.
EPC - Exposure Point Concentration.
HMW - High Molecular Weight.
HQ - Hazard Quotient (Dose/TRV).
LMW - Low Molecular Weight.
LOAEL - Lowest Observed Adverse Effect Level.
MATC - Maximum Allowable Toxicant Concentration.
NA - Not Analyzed.
NC - Not Calculated.
ND - Not Detected.
NOAEL - No Observed Adverse Effects Level.
PAHs - Polycyclic Aromatic Hydrocarbons.
PCBs - Polychlorinated Biphenyls.
TRV - Toxicity Reference Value.

HQs above 1 are bolded and highlighted.
Maximum EPCs for screening level evaluation represent maximum detected concentrations.
MATC-based TRV represents the geometric mean of the NOAEL- and LOAEL-based TRVs.

POTENTIAL RISKS TO THE AMERICAN ROBIN IN TERRESTRIAL EXPOSURE AREA
ECOLOGICAL RISK ASSESSMENT

FIRE TRAINING AREA, NCTAMS LANT DET CUTLER

CUTLER, MAINE

ASSUMPTIONS FOR THE AMERICAN ROBIN	
Average Body Weight (kg)	0.080
Exposure Duration	1
Area Use Factor	1
Soil Consumption Rate (kg_{dw}/day)	0.00076
Water Consumption Rate (kg/day)	0.0113
Soil Invt. Consumption Rate (kg_{dw}/day)	0.012

Total Daily Dose = $\frac{\Sigma([IR_f \times C_f] + [IR_s \times C_s] + [IR_w \times C_w] \times ED \times AUF}{\text{Average Body Weight (kg)}}$

Where:
IR_f = Ingestion rate of food (kg/day)
IR_s = Incidental ingestion rate of sediment or soil (kg/day)
IR_w = Drinking water ingestion rate(L/day)
C_f = Concentration of COPC in food (mg/kg)
C_s= Concentration of COPC in sediment or soil (mg/kg)
C_w= Concentration of COPC in water(mg/L)
ED = Exposure duration (fraction of time receptor spends within exposure area)
AUF = Area use factor (ratio of the receptor's home range relative to the size of exposure area)

Notes:
COPC - Chemical of Potential Concern.
dw - Dry Weight.
EPC - Exposure Point Concentration.
HMW - High Molecular Weight.
HQ - Hazard Quotient (Dose/TRV).
LMW - Low Molecular Weight.
LOAEL - Lowest Observed Adverse Effect Level.
MATC - Maximum Allowable Toxicant Concentration.
NA - Not Analyzed.
NC - Not Calculated.
ND - Not Detected.
NOAEL - No Observed Adverse Effects Level.
PAHs - Polycyclic Aromatic Hydrocarbons.
PCBs - Polychlorinated Biphenyls.
TRV - Toxicity Reference Value.

HQs above 1 are bolded and highlighted.
Maximum EPCs for screening level evaluation represent maximum detected concentrations.
MATC-based TRV represents the geometric mean of the NOAEL- and LOAEL-based TRVs.

POTENTIAL RISKS TO THE SHORT-TAILED SHREW IN TERRESTRIAL EXPOSURE AREA
ECOLOGICAL RISK ASSESSMENT

FIRE TRAINING AREA, NCTAMS LANT DET CUTLER

CUTLER, MAINE

ASSUMPTIONS FOR THE SHORT-TAILED SHREW	
Average Body Weight (kg)	0.0161
Exposure Duration	1
Area Use Factor	1
Soil Consumption Rate (kg_{dw}/day)	0.000013
Water Consumption Rate (kg/day)	0.0036
Soil Invt. Consumption Rate (kg_{dw}/day)	0.0014

$$\text{Total Daily Dose} = \frac{\Sigma([IR_f \times C_f] + [IR_s \times C_s] + [IR_w \times C_w] \times ED \times AUF}{\text{Average Body Weight (kg)}}$$

Where:
IR_f = Ingestion rate of food (kg/day)
IR_s = Incidental ingestion rate of sediment or soil (kg/day)
IR_w = Drinking water ingestion rate(L/day)
C_f = Concentration of COPC in food (mg/kg)
C_s= Concentration of COPC in sediment or soil (mg/kg)
C_w= Concentration of COPC in water(mg/L)
ED = Exposure duration (fraction of time receptor spends within exposure area)
AUF = Area use factor (ratio of the receptor's home range relative to the size of exposure area)

Notes:
COPC - Chemical of Potential Concern.
dw - Dry Weight.
EPC - Exposure Point Concentration.
HMW - High Molecular Weight.
HQ - Hazard Quotient (Dose/TRV).
LMW - Low Molecular Weight.
LOAEL - Lowest Observed Adverse Effect Level.
MATC - Maximum Allowable Toxicant Concentration.
NA - Not Analyzed.
NC - Not Calculated.
ND - Not Detected.
NOAEL - No Observed Adverse Effects Level.
PAHs - Polycyclic Aromatic Hydrocarbons.
PCBs - Polychlorinated Biphenyls.
TRV - Toxicity Reference Value.

HQs above 1 are bolded and highlighted.
Maximum EPCs for screening level evaluation represent maximum detected concentrations.
MATC-based TRV represents the geometric mean of the NOAEL- and LOAEL-based TRVs.

Notes:
Maximum EPCs for screening level evaluation represent maximum detected concentrations.
Potential risk is calculated using the maximum detected concentrations and MATC-based TRVs.
HQs above 1 are bolded and highlighted. COPCs with HQs above 1 in the screening level evaluation were retained for the COPC refinement stage.
MATC-based TRVs represent the geometric mean of the NOAEL- and LOAEL-based TRVs.

COPC - Chemical of Potential Concern.
HMW - High Molecular Weight.
HQ - Hazard Quotient (Dose/TRV).
LMW - Low Molecular Weight.
LOAEL - Lowest Observed Adverse Effect Level.
MATC - Maximum Allowable Toxicant Concentration.
NC - Not Calculated. Avian TRV not available.
NOAEL - No Observed Adverse Effect Level.
PAHs - Polycyclic Aromatic Hydrocarbons.
PCBs - Polychlorinated Biphenyls.
TRV - Toxicity Reference Value.

ATTACHMENT F TABLE 1
EXPOSURE PARAMETERS FOR ECOLOGICAL RECEPTORS IN WETLAND EXPOSURE AREA
ECOLOGICAL RISK ASSESSMENT
FIRE TRAINING AREA, NCTAMS LANT DET CUTLER
CUTLER, MAINE

Receptor Species	Average Body Weight (kg)	Food Ingestion Rate (kg_{dw}/day)	Dietary Assumptions (%; kg_{dw}/day)			Incidental Soil/Sediment Ingestion (%; kg_{dw}/day)	Water Ingestion Rate (L/day)
			Terrestrial Plants	Soil Invertebrates	Benthic Invertebrates		
Birds							
Marsh wren *(Cistothorus palustris)*	0.011 [a]	0.0029 [b]	--	--	100% [c] 0.0029	3.3% [d] 0.000094	0.0028 [e]
Mammals							
Raccoon *(Procyon lotor)*	5.636 [a]	0.1840 [b]	--	--	100% [c] 0.1840	9.4% [d] 0.017	0.47 [e]

General Notes:

See individual organism notes for source, units, and conversion.

All receptors assumed to be present and actively foraging year-round in screening level evaluation (area use factor [AUF] and exposure duration [ED] set at 100%).

BW - Body Weight.

DW - Dry Weight.

FIR - Food Ingestion Rate.

Kg - Kilogram.

L/day - Liters per Day.

Notes for Marsh Wren

[a] Average of adult body weights listed by USEPA (1993).

[b] Food ingestion rate calculated using algorithm for insectivorous birds developed by Nagy, 2001 [FIR (g_{dw}/day) = $0.540*BW^{0.705}$] using average body weight.

[c] An exclusive diet was selected. Benthic invertebrates assumed to represent most relevant dietary exposure for the site.

[d] In the absence of data for the wren, the incidental soil ingestion rate is based on the mallard based on dietary similarities (USACHPPM, 2004).

[e] Water ingestion rate calculated using algorithm for all birds developed by Calder and Braun, 1983 [WIR (kg/day) = $0.059*BW^{0.67}$] using average body weight.

Notes for Raccoon

[a] Average of adult body weights listed by USEPA (1993; value is average of the average values from three studies).

[b] Food ingestion rate calculated using algorithm for carnivores developed by Nagy, et al. (1999) as follows:

FIR (kJ/day)= $(2.23*BW(g)^{0.85})$ using average body weight of 5.636 kg (USEPA, 1993). FIR is converted to kg/day by dividing by 18.7 kJ/g of dry matter for mammalian insectivores (Nagy et al., 1999) and then dividing by 1000.

[c] An exclusive diet was selected. Benthic invertebrates assumed to represent most relevant dietary exposure for the site.

[d] The incidental soil ingestion rate is based on the value identified by Beyer (1994) for raccoons.

[e] Water ingestion rate calculated using algorithm for all mammals developed by Calder and Braun, 1983 [WIR (kg/day) = $0.099*BW^{0.90}$] using average body weight.

Notes:
Maximum EPCs for screening level evaluation represent maximum detected concentrations.
Moisture content assumed to be 78% for benthic invertebrates (USEPA, 1993).
Surface water used as a drinking water source.
Notes continued on following page.

ATTACHMENT F TABLE 2
MEDIA AND TISSUE CONCENTRATIONS FOR WETLAND EXPOSURE AREA
ECOLOGICAL RISK ASSESSMENT
FIRE TRAINING AREA, NCTAMS LANT DET CUTLER
CUTLER, MAINE

COPC - Chemical of Potential Concern.
dw - Dry Weight.
EPC - Exposure Point Concentration.
HMW - High Molecular Weight.
LMW - Low Molecular Weight.
NA - Not Analyzed
ND - Not Detected.
PAHs - Polycyclic Aromatic Hydrocarbons.
PCBs - Polychlorinated Biphenyls.
USEPA - United States Environmental Protection Agency.

[a] Media summary statistics presented in Attachment B of Ecological Risk Assessment appendix.
[b] Benthic invertebrate uptake factors obtained from Bechtel Jacobs (1998; Table 2; all data). Value selected is median uptake factor for depurated and non-depurated invertebrates combined expressed on a dry weight basis.

Invertebrate tissue $_{dw}$ = (uptake factor x sediment concentration)

[c] Median biota-sediment accumulation factor (BSAF) and lipids content for benthic invertebrates obtained from BSAF Data Set available at http://www.epa.gov/med/Prods_Pubs/bsaf.htm. See Attachment F Table 3 for summary.

Median lipid values from supporting studies and median site-specific sediment organic carbon used to determine tissue levels.

Median lipid levels for benthic invertebrates were -
1.6% (0.016 fraction lipids) for HMW and LMW PAHs
4.2% (0.042 fraction lipids) for PCBs
0.50% (0.0050 fraction lipids) for DDD
0.88% (0.0088 fraction lipids) for DDE
0.48% (0.0048 fraction lipids) for DDT
0.45% (0.0045 fraction lipids) for dieldrin

Median site-specific TOC is 16% (0.16 fraction organic carbon) based on 8 samples (see Attachment A for data)..

Invertebrate tissue $_{dw}$ = [BSAF x sediment concentration x (fraction lipid/fraction organic carbon)]/(1-% moisture)

[d] Sediment to invertebrate factors obtained from Screening Level Ecological Risk Assessment Protocol for Hazardous Waste Combustion Facilities: Appendix C, Media-to-Receptor Bioconcentration Factors (USEPA, 1999). Factor calculates tissue on a wet weight basis so tissue concentration is converted to dry weight assuming 78% moisture.

Invertebrate tissue $_{dw}$ = (uptake factor x sediment concentration)/(1-% moisture)

[e] Value for metals without empirical data. Value based on arithmetic average for cadmium, chromium, copper, lead, inorganic mercury, and zinc.
[f] BSAF not available. BSAF and associated information for dieldrin used as a surrogate.

Notes:
Source of information is the BSAF Data Set available at http://www.epa.gov/med/Prods_Pubs/bsaf.htm.
Information presented for whole body freshwater invertebrates.

HMW - High Molecular Weight.
LMW - Low Molecular Weight.
NR - Not Reported.
PAHs - Polycyclic Aromatic Hydrocarbons.
PCBs - Polychlorinated Biphenyls.

Notes:
NOAELs were estimated if a NOAEL was not identified in the literature. The LOAEL was divided by 10 to derive an estimated NOAEL.
LOAELs were estimated if a LOAEL was not identified in the literature. The NOAEL was multiplied by 10 to derive an estimated LOAEL.
LOAEL values from USEPA Eco-SSL documents were calculated as the geometric mean of growth and reproduction LOAEL values.
Additional LOAELs were identified in Sample et al (1996) and in other literature sources used to identify the NOAEL-based TRVs.

COPC - Chemical of Potential Concern.
HMW - High Molecular Weight.
LMW - Low Molecular Weight.
LOAEL - Lowest Observed Adverse Effects Level.
NOAEL - No Observed Adverse Effects Level.
PAHs - Polycyclic Aromatic Hydrocarbons.
PCBs - Polychlorinated Biphenyls.
TRV - Toxicological Reference Value

[a] 7,12-Dimethylbenz(a)anthracene used as a surrogate for PAHs.
[b] 4,4'-DDT used as a surrogate for 4,4'-DDD and 4,4'-DDE.
[c] Endolsulfan used as a surrogate for endosulfan I, endosulfan II, and endosulfan sulfate.
[d] Endrin used as a surrogate for endrin aldehyde and endrin ketone.
[e] Aroclor 1254 used as a surrogate for Total PCBs.

POTENTIAL RISKS TO THE MARSH WREN IN WETLAND EXPOSURE AREA
ECOLOGICAL RISK ASSESSMENT
FIRE TRAINING AREA, NCTAMS LANT DET CUTLER
CUTLER, MAINE

ASSUMPTIONS FOR THE MARSH WREN	
Average Body Weight (kg)	0.011
Exposure Duration	1
Area Use Factor	1
Sediment Consumption Rate (kg_{dw}/day)	0.000094
Water Consumption Rate (kg/day)	0.0028
Invertebrate Consumption Rate (kg_{dw}/day)	0.0029

$$\text{Total Daily Dose} = \frac{\Sigma([IR_f \times C_f] + [IR_s \times C_s] + [IR_w \times C_w] \times ED \times AUF}{\text{Average Body Weight (kg)}}$$

Where:
IR_f = Ingestion rate of food (kg/day)
IR_s = Incidental ingestion rate of sediment or soil (kg/day)
IR_w = Drinking water ingestion rate(L/day)
C_f = Concentration of COPC in food (mg/kg)
C_s= Concentration of COPC in sediment or soil (mg/kg)
C_w= Concentration of COPC in water(mg/L)
ED = Exposure duration (fraction of time receptor spends within exposure area)
AUF = Area use factor (ratio of the receptor's home range relative to

Notes:
COPC - Chemical of Potential Concern.
dw - Dry Weight.
EPC - Exposure Point Concentration.
HQ - Hazard Quotient (Dose/TRV).
LOAEL - Lowest Observed Adverse Effects Level.
MATC - Maximum Allowable Toxicant Concentration.
NA - Not Analyzed.
NC - Not Calculated.
ND - Not Detected.
NOAEL - No Observed Adverse Effects Level.
TRV - Toxicity Reference Value.

HQs above 1 are bolded and highlighted.
Maximum EPCs for screening level evaluation represent maximum detected concentrations.
MATC-based TRV represents the geometric mean of the NOAEL- and LOAEL-based TRVs.

Notes:
Maximum EPCs for screening level evaluation represent maximum detected concentrations.
Potential risk is calculated using the maximum detected concentrations and MATC-based TRVs.
HQs above 1 are bolded and highlighted. COPCs with HQs above 1 in the screening level evaluation were retained for the COPC refinement stage.
MATC-based TRV represents the geometric mean of the NOAEL- and LOAEL-based TRVs.

COPC - Chemical of Potential Concern.
HMW - High Molecular Weight.
HQ - Hazard Quotient (Dose/TRV).
LMW - Low Molecular Weight.
LOAEL - Lowest Observed Adverse Effects Level.
MATC - Maximum Allowable Toxicant Concentration.
NOAEL - No Observed Adverse Effect Level.
PAHs - Polycyclic Aromatic Hydrocarbons.
PCBs - Polychlorinated Biphenyls.
TRV - Toxicity Reference Value.

Notes:
All concentrations are reported in milligrams per kilogram (mg/kg).
COPC - Chemical of Potential Concern.
EPC - Exposure Point Concentration.
FOD - Frequency of Detection.
J - The compound was positively identified; however, the associated numerical value is an estimated concentration only.
NC - Not calculated due to low FOD. At least 10 samples and 6 detects were required to run a UCL. Maximum detected concentration was used as the refined maximum EPC when UCL could not be calculated.
PCBs - Polychlorinated Biphenyls.
SVOCs - Semi-volatile Organic Compounds.
UCL - Upper Confidence Level.
VOCs - Volatile Organic Compounds.

(a) Number of samples detected: Total number of samples.
(b) Minimum detected concentration for each constituent.
(c) Mean of detected concentrations for each constituent.
(d) Maximum detected concentration for each constituent.
(e) Calculated after results for duplicate samples have been resolved as follows: 1) where both the sample and the duplicate are not detected, the resulting value is the average of the limits of detection (LOD); 2) where both the sample and the duplicate are detected, the resulting value is the average of the detected results; and 3) where one of the pair is reported as not detected and the other is detected, the detected concentration will be used.
(f) Kaplan-Meier method mean only calculated for datasets containing non-detects.
(g) Recommended UCL on the arithmetic mean for each constituent, after duplicates have been treated, calculated using ProUCL Version 5.1 with recommended detection limit substitution method for datasets with nondetects (USEPA, 2013). If more than one UCL was recommended, the higher UCL was used.
(h) Arithmetic mean of detects (after duplicates have been averaged) or Kaplan-Meier mean if calculated (datasets containing non-detects).
(i) Lowest of the recommended UCL and the maximum detected concentration.
(j) ProUCL computes and outputs the H-statistic based UCLs for historic reasons only as it often results in unstable (both low and high) values (USEPA, 2010). As such, the 95% Chebyshev UCL was used to estimate the 95% UCL for this data set.

Notes:
All concentrations are reported in milligrams per kilogram (mg/kg).
COPC - Chemical of Potential Concern.
EPC - Exposure Point Concentration.
FOD - Frequency of Detection.
J - The compound was positively identified; however, the associated numerical value is an estimated concentration only.
NC - Not calculated due to low FOD. At least 10 samples and 6 detects were required to run a UCL. Maximum detected concentration was used as the refined maximum EPC when UCL could not be calculated.
PCBs - Polychlorinated Biphenyls.
UCL - Upper Confidence Level.
VOCs - Volatile Organic Compounds.

(a) Number of samples detected: Total number of samples.
(b) Minimum detected concentration for each constituent.
(c) Mean of detected concentrations for each constituent.
(d) Maximum detected concentration for each constituent.
(e) Calculated after results for duplicate samples have been resolved as follows: 1) where both the sample and the duplicate are not detected, the resulting value is the average of the limits of detection (LOD); 2) where both the sample and the duplicate are detected, the resulting value is the average of the detected results; and 3) where one of the pair is reported as not detected and the other is detected, the detected concentration will be used.
(f) Kaplan-Meier method mean only calculated for datasets of sufficient sample size containing non-detects.
(g) Recommended UCL on the arithmetic mean for each constituent, after duplicates have been treated, calculated using ProUCL Version 5.0 with recommended detection limit substitution method for datasets with nondetects (USEPA, 2013). If more than one UCL was recommended, the higher UCL was used.
(h) Arithmetic mean of detects (after duplicates have been averaged) or Kaplan-Meier mean if calculated (datasets of sufficient size containing non-detects).
(i) Lowest of the recommended UCL and the maximum detected concentration.

Notes:
All concentrations are reported in micrograms per liter (ug/L).
COPC - Chemical of Potential Concern.
EPC - Exposure Point Concentration.
FOD - Frequency of Detection.
NC - Not calculated due to low FOD. At least 10 samples and 6 detects were required to run a UCL. Maximum detected concentration was used as the refined maximum EPC when UCL could not be calculated.
PCB - Polychlorinated Biphenyl.
SVOCs - Semi-volatile Organic Compound.
UCL - Upper Confidence Limit.
VOC - Volatile Organic Compound.

[a] Number of samples detected: Total number of samples.
[b] Minimum detected concentration for each constituent.
[c] Calculated after results for duplicate samples have been resolved as follows: 1) where both the sample and the duplicate are not detected, the resulting value is the higher of the limit of detection (LOD); 2) where both the sample and the duplicate are detected, the resulting value is the higher of the detected results; and 3) where one of the pair is reported as not detected and the other is detected, the detected concentration will be used.
[d] Mean of detected concentrations for each constituent.
[e] Maximum detected concentration for each constituent.
[f] Kaplan-Meier method mean only calculated for datasets of sufficient sample size containing non-detects.
[g] Recommended UCL on the arithmetic mean for each constituent, after duplicates have been treated, calculated using ProUCL Version 5.0 with recommended detection limit substitution method for datasets with nondetects (U.S.EPA, 2013). If more than one UCL was recommended, the higher UCL was used.
[h] Lowest of the recommended UCL and the maximum detected concentration.
[i] Arithmethic mean of detects (after duplicates have been averaged) or Kaplan-Meier mean if calculated (datasets of sufficient size containing non-detects).
[j] ProUCL computes and outputs the H-statistic based UCLs for historic reasons only as it often results in unstable (both low and high) values (USEPA, 2010).
As such, the 95% Chebyshev UCL was used to estimate the 95% UCL for this data set.

nu hat (MLE)	18.76	nu star (bias corrected)	13.06
Mean (detects)	1.554		

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Minimum	0.01	Mean	0.782
Maximum	5.5	Median	0.17
SD	1.49	CV	1.906
k hat (MLE)	0.327	k star (bias corrected MLE)	0.308

Nonparametric Distribution Free UCL Statistics

Detected Data appear Approximate Gamma Distributed at 5% Significance Level

Suggested UCL to Use

Gamma Adjusted KM-UCL (use when k<=1 and 15 < n < 50 but k<=1)	2.228

When a data set follows an approximate (e.g., normal) distribution passing one of the GOF test
When applicable, it is suggested to use a UCL based upon a distribution (e.g., gamma) passing both GOF tests in ProUCL

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
Recommendations are based upon data size, data distribution, and skewness.
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

Suggested UCL to Use

95% Adjusted Gamma UCL 10.15

When a data set follows an approximate (e.g., normal) distribution passing one of the GOF test

When applicable, it is suggested to use a UCL based upon a distribution (e.g., gamma) passing both GOF tests in ProUCL

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.

Recommendations are based upon data size, data distribution, and skewness.

These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).

However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Suggested UCL to Use

95% Adjusted Gamma UCL 0.538

When a data set follows an approximate (e.g., normal) distribution passing one of the GOF test

When applicable, it is suggested to use a UCL based upon a distribution (e.g., gamma) passing both GOF tests in ProUCL

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.

Recommendations are based upon data size, data distribution, and skewness.

These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).

However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

Detected data appear Gamma Distributed at 5% Significance Level

Gamma Statistics on Detected Data Only

k hat (MLE)	20.85	k star (bias corrected MLE)	19.53
Theta hat (MLE)	1.303	Theta star (bias corrected MLE)	1.39
nu hat (MLE)	1960	nu star (bias corrected)	1836
Mean (detects)	27.16		

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Minimum	13.9	Mean	26.88
Maximum	42.3	Median	26.65
SD	6.269	CV	0.233
k hat (MLE)	18.41	k star (bias corrected MLE)	17.28

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Suggested UCL to Use

ı Adjusted KM-UCL (use when k<=1 and 15 < n < 50 but k<=1) 0.0544

When a data set follows an approximate (e.g., normal) distribution passing one of the GOF test
When applicable, it is suggested to use a UCL based upon a distribution (e.g., gamma) passing both GOF tests in ProUCL

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
Recommendations are based upon data size, data distribution, and skewness.
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

Suggested UCL to Use

95% KM (t) UCL 0.195

When a data set follows an approximate (e.g., normal) distribution passing one of the GOF test
When applicable, it is suggested to use a UCL based upon a distribution (e.g., gamma) passing both GOF tests in ProUCL

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
Recommendations are based upon data size, data distribution, and skewness.
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Suggested UCL to Use

95% KM (t) UCL 5.196

When a data set follows an approximate (e.g., normal) distribution passing one of the GOF test
When applicable, it is suggested to use a UCL based upon a distribution (e.g., gamma) passing both GOF tests in ProUCL

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
Recommendations are based upon data size, data distribution, and skewness.
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

95% KM (t) UCL 2.867

When a data set follows an approximate (e.g., normal) distribution passing one of the GOF test
When applicable, it is suggested to use a UCL based upon a distribution (e.g., gamma) passing both GOF tests in ProUCL

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
Recommendations are based upon data size, data distribution, and skewness.
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Receptor Species	Average Body Weight (kg)	Food Ingestion Rate (kg_{dw}/day)	Dietary Assumptions (%; kg_{dw}/day)		Incidental Soil/Sediment Ingestion (%; kg_{dw}/day)	Water Ingestion Rate (L/day)	Exposure Duration	Area Use Factor
			Terrestrial Plants	Soil Invertebrates				
Birds								
American robin *(Turdus migratorius)*	0.0804 [a]	0.0119 [b]	--	100% [c] 0.0119	6.4% [d] 0.00076	0.0113 [e]	0.5 [f]	1 [g]
Mammals								
Meadow vole *(Microtus pennsylvanicus)*	0.0358 [a]	0.00174 [b]	100% [c] 0.00174	--	1.2% [d] 0.000021	0.0075 [e]	1 [f]	1 [g]
Short-tailed shrew *(Blarina brevicauda)*	0.0161 [a]	0.00143 [b]	--	100% [c] 0.0014	0.90% [d] 0.000013	0.0036 [e]	0.5 [f]	1 [g]

General Notes:

See individual organism notes for source, units, and conversion.

BW - Body Weight. FIR - Food Ingestion Rate. L/day - Liters per Day.

DW - Dry Weight. Kg - Kilogram.

Notes for American robin

[a] Average of adult body weights listed by USEPA (1993).

[b] Food ingestion rates were calculated from Nagy et al. (1999) for insectivorous birds as follows:
FIR (kJ/day)= (9.7*BW(g) $^{0.705}$) using average body weight of 0.0804 kg (USEPA, 1993). FIR is converted to kg/day by dividing by 18 kJ/g of dry matter for avian insectivores (Nagy et al., 1999) and then dividing by 1000.

[c] An exclusive soil invertebrate diet was selected.

[d] In the absence of data for the robin, the incidental soil ingestion rate is based on 50th percentile value for woodcock (USEPA, 2007a).

[e] Water ingestion rate of 0.14 L/day (USEPA, 1993) multiplied by average body weight.

[f] Northern robins migrate during the winter months typically between October to March (USEPA, 1993).

[g] Assumed the exposure area can support the entire dietary needs of the robin.

Notes for Meadow vole

[a] Average of adult body weights listed by USEPA (1993).

[b] Average food ingestion rate of 0.33 g/g/day (USEPA, 1993) multiplied by average body weight of 0.0358 kg (USEPA, 1993) and 0.15 to convert to dry weight (grass ingestion).

[c] An exclusive terrestrial plant diet was selected.

[d] The incidental soil ingestion rate is based on 50th percentile value for vole (USEPA, 2007a).

[e] Maximum water ingestion rate of 0.21 L/day (USEPA, 1993) multiplied by average body weight.

[f] Vole assumed to be actively foraging all year round.

[g] Assumed the exposure area can support the entire dietary needs of the vole.

Notes for Short-tailed shrew

[a] Average of adult body weights listed by USEPA (1993).

[b] Average food ingestion rate of 0.555 g/g/day (USEPA, 1993) multiplied by average body weight of 0.0161 kg (USEPA, 1993) and 0.16 to convert to dry weight (earthworm ingestion).

[c] An exclusive soil invertebrate diet was selected.

[d] The incidental soil ingestion rate is based on 50th percentile value for shrew (USEPA, 2007a).

[e] Water ingestion rate of 0.223 L/day (USEPA, 1993) multiplied by average body weight.

[f] Foraging for soil invertebrates is assumed to be limited or not possible for approximately 6 months of the year (October through March) when colder air and soil temperatures limit invertebrate activity (Edwards and Bohlen, 1996).

[g] Assumed the exposure area can support the entire dietary needs of the shrew.

Notes:
Refined maximum EPCs are the recommended upper confidence limit (UCL) on the arithmetic mean (or the maximum detected concentration if a UCL could not be calculated).
Average EPCs represent the average of the detects (if all samples were detected) or the Kaplan-Meier mean (if data set included non-detects).
Unless otherwise noted, uptake factors derive tissue concentrations on a dry weight basis.

COPC - Chemical of Potential Concern.
dw - Dry Weight.
EPC - Exposure Point Concentration.
NA - Not Analyzed
ND - Not Detected.
PCBs - Polychlorinated Biphenyls.
USEPA - United States Environmental Protection Agency.

[a] Summary statistics and EPCs for Tier 2, Step 3a refinement presented in Attachment G of the Ecological Risk Assessment appendix.
[b] Site-specific soil-to-worm regression equation derived for the Very Low Frequency (VLF) Peninsula (Resolution, 2015) adjusted to present dry weight tissue concentration assuming 84% moisture.

cadmium	tissue concentration = [9.235 * (soil concentration) + 1.801]/(1-% moisture)]
chromium	tissue concentration = [0.3008 * (soil concentration) - 2.1796]/(1-% moisture)]
lead	tissue concentration = [0.7107 * (soil concentration) - 18.466]/(1-% moisture)]

lead	ln(tissue concentration) = 0.561 * ln(soil concentration) - 1.328
selenium	ln(tissue concentration) = 1.104 * ln(soil concentration) - 0.677
zinc	ln(tissue concentration) = 0.554 * ln(soil concentration) + 1.575
Total LMW PAHs	ln(tissue concentration) = 0.4544 * ln(soil concentration) - 1.3205
Total HMW PAHs	ln(tissue concentration) = 0.9469 * ln(soil concentration) - 1.7026

[g] Value for Aroclor 1254 used for Total PCBs.
[h] Value for endrin used as a surrogate due to structural similarity.
[i] Soil-to-plant uptake factors from Bechtel Jacobs (1998) - median value from Table 6.
[j] VLF soil-to-worm regression equation estimates a worm concentration of less than 0 mg/kg; therefore, a value of 0 mg/kg is used as the estimated worm tissue concentration.
[k] Values identified using the Risk Assessment Information System (http://rais.ornl.gov/cgi-bin/tools/TOX_search?select=chem_spef; accessed September 13, 2016).

Notes:
NOAELs were estimated if a NOAEL was not identified in the literature. The LOAEL was divided by 10 to derive an estimated NOAEL.
LOAELs were estimated if a LOAEL was not identified in the literature. The NOAEL was multiplied by 10 to derive an estimated LOAEL.
LOAEL values from USEPA Eco-SSL documents were calculated as the geometric mean of growth and reproduction LOAEL values.
Additional LOAELs were identified in Sample et al (1996) and in other literature sources used to identify the NOAEL-based TRVs.

COPC - Chemical of Potential Concern.
LOAEL - Lowest Observed Adverse Effects Level.
NOAEL - No Observed Adverse Effects Level.
PCBs - Polychlorinated Biphenyls.
TRV - Toxicological Reference Value

[a] 7,12-Dimethylbenz(a)anthracene used as a surrogate for PAHs.
[b] Endrin used as a surrogate for endrin aldehyde and endrin ketone.
[c] Aroclor 1254 used as a surrogate for Total PCBs.

POTENTIAL RISKS TO THE AMERICAN ROBIN IN TERRESTRIAL EXPOSURE AREA - REFINED MAXIMUM EPC
ECOLOGICAL RISK ASSESSMENT

FIRE TRAINING AREA, NCTAMS LANT DET CUTLER

CUTLER, MAINE

ASSUMPTIONS FOR THE AMERICAN ROBIN	
Average Body Weight (kg)	0.080
Exposure Duration (migrates out of area October-March)	0.50
Area Use Factor	1
Soil Consumption Rate (kg_{dw}/day)	0.00076
Water Consumption Rate (kg/day)	0.0113
Soil Invt. Consumption Rate (kg_{dw}/day)	0.012

Total Daily Dose = $\frac{\Sigma([IR_f \times C_f] + [IR_s \times C_s] + [IR_w \times C_w] \times ED \times AUF}{\text{Average Body Weight (kg)}}$

Where:
IR_f = Ingestion rate of food (kg/day)
IR_s = Incidental ingestion rate of sediment or soil (kg/day)
IR_w = Drinking water ingestion rate(L/day)
C_f = Concentration of COPC in food (mg/kg)
C_s= Concentration of COPC in sediment or soil (mg/kg)
C_w= Concentration of COPC in water(mg/L)
ED = Exposure duration (fraction of time receptor spends within exposure area)
AUF = Area use factor (ratio of the receptor's home range relative to the size of exposure area)

Notes:
COPC - Chemical of Potential Concern.
dw - Dry Weight.
EPC - Exposure Point Concentration.
HQ - Hazard Quotient (Dose/TRV).
LOAEL - Lowest Observed Adverse Effects Level.
NA - Not Available.
NC - Not Calculated.
NOAEL - No Observed Adverse Effects Level.
TRV - Toxicity Reference Value.

HQs above 1 are bolded and highlighted.
Refined maximum EPCs are the recommended upper confidence limit (UCL) on the arithmetic mean (or the maximum detected concentration if a UCL could not be calculated).

POTENTIAL RISKS TO THE SHORT-TAILED SHREW IN TERRESTRIAL EXPOSURE AREA - REFINED MAXIMUM EPC
ECOLOGICAL RISK ASSESSMENT

FIRE TRAINING AREA, NCTAMS LANT DET CUTLER

CUTLER, MAINE

ASSUMPTIONS FOR THE SHORT-TAILED SHREW	
Average Body Weight (kg)	0.0161
Exposure Duration (minimal invertebrate foraging October-March)	0.50
Area Use Factor	1
Soil Consumption Rate (kg_{dw}/day)	0.000013
Water Consumption Rate (kg/day)	0.0036
Soil Invt. Consumption Rate (kg_{dw}/day)	0.0014

$$\text{Total Daily Dose} = \frac{\Sigma([IR_f \times C_f] + [IR_s \times C_s] + [IR_w \times C_w] \times ED \times AUF}{\text{Average Body Weight (kg)}}$$

Where:
IR_f = Ingestion rate of food (kg/day)
IR_s = Incidental ingestion rate of sediment or soil (kg/day)
IR_w = Drinking water ingestion rate(L/day)
C_f = Concentration of COPC in food (mg/kg)
C_s= Concentration of COPC in sediment or soil (mg/kg)
C_w= Concentration of COPC in water(mg/L)
ED = Exposure duration (fraction of time receptor spends within exposure area)
AUF = Area use factor (ratio of the receptor's home range relative to the size of exposure area)

Notes:
COPC - Chemical of Potential Concern.
dw - Dry Weight.
EPC - Exposure Point Concentration.
HQ - Hazard Quotient (Dose/TRV).
LOAEL - Lowest Observed Adverse Effects Level.
NOAEL - No Observed Adverse Effects Level.
TRV - Toxicity Reference Value.

HQs above 1 are bolded and highlighted.
Refined maximum EPCs are the recommended upper confidence limit (UCL) on the arithmetic mean (or the maximum detected concentration if a UCL could not be calculated).

Notes:
Refined maximum EPCs are the recommended upper confidence limit (UCL) on the arithmetic mean (or the maximum detected concentration if a UCL could not be calculated).
Average EPCs represent the average of the detects (if all samples were detected) or the Kaplan-Meier mean (if data set included non-detects).
Potential risk is calculated using the refined maximum and average EPCs and NOAEL- and LOAEL-based TRVs.
HQs above 1 are bolded and highlighted.

COPC - Chemical of Potential Concern.
HQ - Hazard Quotient.
LOAEL - Lowest Observed Adverse Effect Level.
NC - Not Calculated. Avian TRV not available.
nCOPC - Not a COPC for this media/receptor combinaion.
NOAEL - No Observed Adverse Effect Level.
PCBs - Polychlorinated Biphenyls.
TRV - Toxicity Reference Value.

ATTACHMENT I TABLE 1
EXPOSURE PARAMETERS FOR ECOLOGICAL RECEPTORS IN WETLAND EXPOSURE AREA
ECOLOGICAL RISK ASSESSMENT
FIRE TRAINING AREA, NCTAMS LANT DET CUTLER
CUTLER, MAINE

Receptor Species	Average Body Weight (kg)	Food Ingestion Rate (kg_{dw}/day)	Dietary Assumptions (%; kg_{dw}/day) Benthic Invertebrates	Incidental Soil/Sediment Ingestion (%; kg_{dw}/day)	Water Ingestion Rate (L/day)	Exposure Duration	Area Use Factor
Birds							
Marsh wren *(Cistothorus palustris)*	0.011 [a]	0.0029 [b]	100% [c] 0.0029	3.3% [d] 0.000094	0.0028 [e]	0.5 [f]	1 [g]
Mammals							
Raccoon *(Procyon lotor)*	5.636 [a]	0.1840 [b]	100% [c] 0.1840	9.4% [d] 0.017	0.47 [e]	0.67 [f]	0.05 [g]

General Notes:

See individual organism notes for source, units, and conversion.

AUF - Area Use Factor.
BW - Body Weight.
DW - Dry Weight.
FIR - Food Ingestion Rate.
Kg - Kilogram.
L/day - Liters per Day.

Notes for Marsh Wren

[a] Average of adult body weights listed by USEPA (1993).
[b] Food ingestion rate calculated using algorithm for insectivorous birds developed by Nagy, 2001 [FIR (g_{dw}/day) = 0.540*$BW^{0.705}$] using average body weight.
[c] An exclusive diet was selected. Benthic invertebrates assumed to represent most relevant dietary exposure for the site.
[d] In the absence of data for the wren, the incidental soil ingestion rate is based on the mallard based on dietary similarities (USACHPPM, 2004).
[e] Water ingestion rate calculated using algorithm for all birds developed by Calder and Braun, 1983 [WIR (kg/day) = 0.059*$BW^{0.67}$] using average body weight.
[f] Marsh wrens migrate during the winter months typically between October to March (USEPA, 1993).
[g] Assumed the exposure area can support the entire dietary needs of the marsh wren.

Notes for Raccoon

[a] Average of adult body weights listed by USEPA (1993; value is average of the average values from three studies).
[b] Food ingestion rate calculated using algorithm for carnivores developed by Nagy, et al. (1999) as follows:
FIR (kJ/day)= (2.23*BW(g) $^{0.85}$) using average body weight of 5.636 kg (USEPA, 1993). FIR is converted to kg/day by dividing by 18.7 kJ/g of dry matter for mammalian insectivores (Nagy et al., 1999) and then dividing by 1000.
[c] An exclusive diet was selected. Benthic invertebrates assumed to represent most relevant dietary exposure for the site.
[d] The incidental soil ingestion rate is based on the value identified by Beyer (1994) for raccoons.
[e] Water ingestion rate calculated using algorithm for all mammals developed by Calder and Braun, 1983 [WIR (kg/day) = 0.099*$BW^{0.90}$] using average body weight.
[f] Foraging for benthic or soil invertebrates is assumed to be limited or not possible for approximately 4 months of the year when frozen surface water and when colder air and soil temperatures limit invertebrate activity (Edwards and Bohlen, 1996).
[g] The AUF based on the raccoon home range (1558 acres) and approximately 3.3 acres of FTA wetlands is equal to 0.0021.
An AUF of 0.05 was assumed in the event that the FTA wetlands provide more attractive habitat than other areas.

ATTACHMENT I TABLE 2
MEDIA AND TISSUE CONCENTRATIONS FOR WETLAND EXPOSURE AREA
ECOLOGICAL RISK ASSESSMENT
FIRE TRAINING AREA, NCTAMS LANT DET CUTLER
CUTLER, MAINE

	Measured Media Concentrations [a]				**Estimated Benthic Invertebrate Tissue**			
COPC	Refined Maximum Sediment EPC (mg/kg_{dw})	Average Sediment EPC (mg/kg_{dw})	Refined Maximum Surface Water EPC (mg/L)	Average Surface Water EPC (mg/L)	Sediment-to-Invertebrate Uptake Factor		Refined Maximum Benthic Invertebrate Tissue EPC (mg/kg_{dw})	Average Benthic Invertebrate Tissue EPC (mg/kg_{dw})
Inorganics								
COPPER	57.1	43.1	0.0066	0.0042	1.556	[b]	88.8	67.1
MERCURY	0.14	0.088	ND	ND	1.1	[b]	0.16	0.10
SELENIUM	2.2	0.95	0.00082	0.00059	0.9	[c,d]	9.1	3.9

Notes:
Refined maximum EPCs are the recommended upper confidence limit (UCL) on the arithmetic mean (or the maximum detected concentration if a UCL could not be calculated).
Average EPCs represent the average of the detects (if all samples were detected) or the Kaplan-Meier mean (if data set included non-detects).
Moisture content assumed to be 78% for benthic invertebrates (USEPA, 1993).
Surface water used as a drinking water source.

COPC - Chemical of Potential Concern.
dw - Dry Weight.
EPC - Exposure Point Concentration.
ND - Not Detected.
PCBs - Polychlorinated Biphenyls.
USEPA - United States Environmental Protection Agency.

[a] Summary statistics and EPCs for Tier 2, Step 3a refinement presented in Attachment G of the Ecological Risk Assessment appendix.
[b] Benthic invertebrate uptake factors obtained from Bechtel Jacobs (1998; Table 2; all data). Value selected is median uptake factor for depurated and non-depurated invertebrates combined expressed on a dry weight basis.

Invertebrate tissue $_{dw}$ = (uptake factor x sediment concentration)

[c] Sediment to invertebrate factors obtained from Screening Level Ecological Risk Assessment Protocol for Hazardous Waste Combustion Facilities: Appendix C, Media-to-Receptor Bioconcentration Factors (USEPA, 1999). Factor calculates tissue on a wet weight basis so tissue concentration is converted to dry weight assuming 78% moisture.

Invertebrate tissue $_{dw}$ = (uptake factor x sediment concentration)/(1-% moisture)

[d] Value for metals without empirical data. Value based on arithmetic average for cadmium, chromium, copper, lead, inorganic mercury, and zinc.

SELENIUM	*0.661*	*LOAEL*	*reproduction & growth*	*chronic*	*mammals*	*USEPA, 2007b*	

Notes:
NOAELs were estimated if a NOAEL was not identified in the literature. The LOAEL was divided by 10 to derive an estimated NOAEL.
LOAELs were estimated if a LOAEL was not identified in the literature. The NOAEL was multiplied by 10 to derive an estimated LOAEL.
LOAEL values from USEPA Eco-SSL documents were calculated as the geometric mean of growth and reproduction LOAEL values.
Additional LOAELs were identified in Sample et al (1996) and in other literature sources used to identify the NOAEL-based TRVs.

COPC - Chemical of Potential Concern.
LOAEL - Lowest Observed Adverse Effects Level.
NOAEL - No Observed Adverse Effects Level.
TRV - Toxicological Reference Value
USEPA - United States Environmental Protection Agency.

ATTACHMENT I TABLE 4
POTENTIAL RISKS TO THE MARSH WREN IN WETLAND EXPOSURE AREA - REFINED MAXIMUM EPC
ECOLOGICAL RISK ASSESSMENT
FIRE TRAINING AREA, NCTAMS LANT DET CUTLER
CUTLER, MAINE

ASSUMPTIONS FOR THE MARSH WREN	
Average Body Weight (kg)	0.011
Exposure Duration (migrates out of area October-March)	0.50
Area Use Factor	1
Sediment Consumption Rate (kg_{dw}/day)	0.000094
Water Consumption Rate (kg/day)	0.0028
Invertebrate Consumption Rate (kg_{dw}/day)	0.0029

Total Daily Dose = $\frac{\Sigma([IR_f \times C_f] + [IR_s \times C_s] + [IR_w \times C_w] \times ED \times AUF}{\text{Average Body Weight (kg)}}$

Where:
IR_f = Ingestion rate of food (kg/day)
IR_s = Incidental ingestion rate of sediment or soil (kg/day)
IR_w = Drinking water ingestion rate(L/day)
C_f = Concentration of COPC in food (mg/kg)
C_s= Concentration of COPC in sediment or soil (mg/kg)
C_w= Concentration of COPC in water(mg/L)
ED = Exposure duration (fraction of time receptor spends within exposure area)
AUF = Area use factor (ratio of the receptor's home range relative to the size of exposure area)

Notes:
COPC - Chemical of Potential Concern.
dw - Dry Weight.
EPC - Exposure Point Concentration.
HQ - Hazard Quotient (Dose/TRV).
LOAEL - Lowest Observed Adverse Effects Level.
NC - Not Calculated.
ND - Not Detected.
NOAEL - No Observed Adverse Effects Level.
TRV - Toxicity Reference Value.

HQs above 1 are bolded and highlighted.
Refined maximum EPCs are the recommended upper confidence limit (UCL) on the arithmetic mean (or the maximum detected concentration if a UCL could not be calculated).

ATTACHMENT I TABLE 6
POTENTIAL RISKS TO THE RACCOON IN WETLAND EXPOSURE AREA - REFINED MAXIMUM EPC
ECOLOGICAL RISK ASSESSMENT
FIRE TRAINING AREA, NCTAMS LANT DET CUTLER
CUTLER, MAINE

ASSUMPTIONS FOR THE RACCOON	
Average Body Weight (kg)	5.636
Exposure Duration (temps below freezing December-March)	0.67
Area Use Factor	0.05
Sediment Consumption Rate (kg_{dw}/day)	0.017
Water Consumption Rate (kg/day)	0.47
Invertebrate Consumption Rate (kg_{dw}/day)	0.18

$$\text{Total Daily Dose} = \frac{\Sigma([IR_f \times C_f] + [IR_s \times C_s] + [IR_w \times C_w] \times ED \times AUF}{\text{Average Body Weight (kg)}}$$

Where:
IR_f = Ingestion rate of food (kg/day)
IR_s = Incidental ingestion rate of sediment or soil (kg/day)
IR_w = Drinking water ingestion rate(L/day)
C_f = Concentration of COPC in food (mg/kg)
C_s = Concentration of COPC in sediment or soil (mg/kg)
C_w = Concentration of COPC in water(mg/L)
ED = Exposure duration (fraction of time receptor spends within exposure area)
AUF = Area use factor (ratio of the receptor's home range relative to the size of exposure area)

Notes:
COPC - Chemical of Potential Concern.
dw - Dry Weight.
EPC - Exposure Point Concentration.
HQ - Hazard Quotient (Dose/TRV).
LOAEL - Lowest Observed Adverse Effects Level.
NOAEL - No Observed Adverse Effects Level.
TRV - Toxicity Reference Value.

HQs above 1 are bolded and highlighted.
Refined maximum EPCs are the recommended upper confidence limit (UCL) on the arithmetic mean (or the maximum detected concentration if a UCL could not be calculated).
The AUF based on the raccoon home range (1558 acres) and approximately 3.3 acres of FTA wetlands is equal to 0.0021. An AUF of 0.05 was assumed in the event that the FTA wetlands provide more attractive habitat than other areas.

Notes:

ND - Not Detected.

See Attachment A for data tables.

RL - Reporting Limit.

U - Not Detected at Specified Reporting Limit.

ND = RL Data Treatment - Total PCBs were calculated per sample by summing the individual Aroclor concentrations for detected results and the full reporting detection limit for non-detect results. For samples without any detections of individual Aroclors, the maximum reporting detection limit within the sample is presented as a non-detect value. This value is considered in the uncertainty section of the risk assessment.

ND = 0 Data Treatment - Total PCBs were calculated per sample by summing only the detected individual Aroclor concentrations. For samples without any detections of individual Aroclors, the maximum reporting detection limit within the sample is presented as a non-detect value. This approach was used in the risk assessment.

ATTACHMENT J TABLE 2

SUMMARY OF TOTAL PAHs IN SOIL AND SEDIMENT USING TWO DATA TREATMENT METHODS

ECOLOGICAL RISK ASSESSMENT
FIRE TRAINING AREA, NCTAMS LANT DET CUTLER
CUTLER, MAINE

Notes:

ND - Not Detected. See Attachment A for data tables.

RL - Reporting Limit.

U - Not Detected at Specified Reporting Limit.

ND = RL Data Treatment - Total PAHs were calculated per sample by summing the individual PAH concentrations for detected results and the full reporting detection limit for non-detect results. For samples without any detections of individual PAHs, the maximum reporting detection limit within the sample is presented as a non-detect value. This value is considered in the uncertainty section of the risk assessment.

ND = 0 Data Treatment - Total PAHs were calculated per sample by summing only the detected individual PAH concentrations. For samples without any detections of individual PAHs, the maximum reporting detection limit within the sample is presented as a non-detect value. This approach was used in the risk assessment.

1.0 INTRODUCTION

This Technical Memorandum presents the results of the September 2015 groundwater sampling event conducted at Site 1, Fire Training Area (FTA) of the Naval Computer and Telecommunications Area Master Station Atlantic Detachment (NCTAMS LANT Det) in Cutler, Maine. This project was completed by Resolution Consultants on behalf of the Naval Facilities Engineering Command (Navy) under the Comprehensive Long-Term Environmental Action Navy Contract Number N62470-11-D-8013, Contract Task Order WE 33. This work was conducted in accordance with the Administrative Order of Consent between the Navy and the Maine Department of Environmental Protection (MEDEP), who is the lead regulatory agency, and in accordance with the Comprehensive Environmental Response, Compensation, and Liability Act requirements.

The NCTAMS LANT Det Cutler is located near the town of Cutler, Washington County, Maine. Construction began in the late 1950s, and on June 23, 1961, NCTAMS LANT Det Cutler was established as a communications facility for the United States Navy. The facility occupied approximately 2,300 acres originally consisting of three main areas: 1) the Administrative and Housing Area, 2) the High Frequency Area, and 3) the Very Low Frequency (VLF) Area. In December 2003, the Administrative and Housing Area was transferred to the Cutler Development Corporation and is therefore no longer part of the military facility.

The FTA (referred to as the site) is located on the north end of the Cutler Peninsula, to the north of the VLF antenna array, east of Holmes and Machias Bays and west of Little Machias Bay (**Figure F-1**). The FTA is an abandoned gravel pit that was reportedly used for fire-training exercises by NCTAMS LANT Det Cutler personnel from the 1960s through the 1980s.

Undeveloped forested land and several freshwater wetlands (known locally as heaths) surround the site. The site was historically used for firefighting operations and disposal of fuel oil. A removal action has been conducted in the center of the site and a wetland was constructed during restoration activities. The rest of the site is mainly located in an open (cleared) area, with a forested area around the perimeter.

2.0 REMEDIAL INVESTIGATION OF THE FIRE TRAINING AREA

Multiple Remedial Investigation (RI) activities have been conducted at the FTA starting in 1991. RI activities have included multiple removal actions, surface and subsurface soil sampling, and groundwater monitoring. Previous groundwater sampling events have occurred at the FTA from 1999 to 2014. Volatile organic compounds (VOCs), extractable petroleum hydrocarbons (EPH), volatile petroleum hydrocarbons (VPH), and metals have been detected above project screening levels (PSLs) in groundwater at the FTA. The PSLs for groundwater are listed in **Table F-2** and discussed in detail in Section 4.2.4 of the RI.

As part of the RI conducted for the FTA, groundwater samples were collected at 12 monitoring well locations September 2015 as part of a sampling program to determine whether the groundwater has been impacted via contaminant runoff. Historically, low levels of VOCs and petroleum were detected in groundwater and the current samples will assess current groundwater conditions. The wells sampled in the June 2014 and September 2015 event included:

- FTA-MW-1
- FTA-MW-5
- FTA-MW-9
- FTA-MW-10
- FTA-MW-11
- FTA-MW-12
- FTA-MW-14
- FTA-MW-206
- FTA-MW-208
- FTA-MW-210
- FTA-MW-218
- FTA-DP-35

Figure F-2 presents the locations of the sampled monitoring wells. In accordance with the Sampling and Analysis Plan (SAP), groundwater samples were collected and analyzed for volatile organic compounds (including vinyl chloride by SIM analysis), VPH/EPH, semivolatile organic compounds (SVOCs) (including low level PAHs), and total and dissolved metals. Additionally, the monitoring wells were analyzed for poly- and perfluoroalkyl substances (PFAS), as part of the new emerging contaminant protocol (Resolution 2015). The data validation report is included in **Attachment A**.

3.0 SAMPLING OBJECTIVES

The primary objectives of the September 2015 FTA groundwater sampling event were to:

- Collect additional data to evaluate the current groundwater conditions at the FTA and confirm historical trends of contaminants of potential concern (COPCs).
- Obtain an additional groundwater dataset for use in the risk assessment which will be conducted as part of the RI report for the FTA.

4.0 SUMMARY OF FIELD ASSESSMENT RESULTS

Section 4.0 presents the results of the groundwater sampling conducted at the FTA in September 2015. Analytical results from the investigation were provided to MEDEP in their Electronic Data Deliverable format under separate cover.

4.1 Groundwater Elevations

Groundwater measurements were completed on two separate events; once during June 2015 and once during September 2015. The groundwater elevation data and measurements are presented in **Table F-1**.

Groundwater contour maps are illustrated on **Figure F-3** and **Figure F-4** based on groundwater measurements obtained in June and September 2015. Based on the groundwater elevations measured, groundwater appears to flow from south to northeast toward the constructed wetland. Groundwater flow appears to be consistent with topography and surface drainage at the site. Groundwater elevations illustrated on **Figure F-3** and **Figure F-4** are referenced to an arbitrary site datum rather than mean sea level.

4.2 Sampling Methodology

The groundwater sampling events were conducted from September 15 to 21, 2015. Prior to sample collection, water levels were measured to the nearest 0.01 feet using a water level meter. Water levels were used to develop groundwater contours and interpret flow direction. Monitoring wells were purged via low-flow sampling methodology using a peristaltic pump and polypropylene tubing. Water quality parameters including temperature, pH, specific conductivity, dissolved oxygen, turbidity and oxidation-reduction potential were measured in a flow-through cell during purging using an YSI 6820 v2 water quality meter. Purging continued until water quality parameters reached stabilization, at which point samples were collected.

Samples were collected into laboratory-supplied containers and submitted to the analytical laboratory for analysis of selected parameters. Samples were packaged on ice and transported via overnight commercial carrier under standard chain-of-custody procedures to Katahdin Analytical Services in Portland, Maine.

Quality control (QC) samples collected included field duplicates, matrix spike and matrix spike duplicate, and trip blanks. Field duplicates were collected at a rate of 10% and MS/MSD samples were collected at the rate of 5%. QC samples were analyzed for the same parameters as the accompanying samples. Trip blanks accompanied each cooler containing sample for VOC analysis. A temperature blank was also placed in each cooler to check that samples are preserved at or below four degrees Celsius during shipment.

4.3 Groundwater Analytical Results

A summary of the analytical results from the September 2015 groundwater sampling is presented below and in **Table F-2**.

4.3.1 Diesel/Gasoline Range Organics and EPH/VPH

The most heavily contaminated groundwater is found northwest and east of the FTA site, in the direction of groundwater flow from the spill area. Sampling conducted as part of site investigations prior to installation that contaminants were present in the FTA because concentrations were found to be at levels far exceeding the maximum contaminant levels (MCLs), starting in 1999. Historically, Maine required evaluation of petroleum contamination using diesel range organics (DRO) and gasoline range organics (GRO) analytical procedures, which measured the total concentration of petroleum hydrocarbon compounds, because cleanup guidelines were expressed in DRO and GRO. However, in 2010, the MEDEP developed a framework to evaluate petroleum contamination using hydrocarbon fractions of toxicological risk-based guidelines, developing the EPH and VPH standards. Starting in 2012, the SAP was revised to sample for EPH/VPH, versus the DRO/GRO standards.

In accordance with the SAP, EPH/VPH analyses were performed on samples collected at all 12 locations. Historically, petroleum contamination was found at the site; however, the petroleum impacts relating to the firefighting activities in the central portion of the FTA site were removed in a series of remedial excavations and replaced with clean fill. As of 2014, only the MW-5 location had a detection of EPH (C11–C22) at a concentration of 49 micrograms per liter (µg/L). The results of this sampling event in September 2015 indicate that there were no detections of COPCs above the MCL.

4.3.2 Volatile Organic Compounds

General decreasing trends in detected concentrations of site-related contaminants continue to be observed at many of the sampling locations for the VOCs of concern. These downward trends are most notably evident in results dating from 1999, to the most recent sampling event in 2015 (**Table F-3**). Historically, the prominent contaminants of concern included vinyl chloride, cis-1,2-dichloroethene, trichloroethene (TCE), and tetrachloroethene. The lower-order halogenated organics such as vinyl chloride may be the products of biological degradation of the more highly chlorinated compounds such as TCE.

Eleven of the 12 wells sampled show TCE concentrations below the MCL or non-detect for the recent sampling. FTA-MW-206 was the only sampling location to have a detection of TCE at a concentration of 10 µg/L.

Eleven of the 12 wells sampled in June 2014 show cis-1,2-dichloroethene concentrations below the MCL or non-detect for the recent sampling. FTA-MW-206 was the only sampling location in to have a detection of cis-1,2-dichloroethene (22 µg/L).

4.3.3 Semivolatile Organic Compounds

Historically, there have been no detections of significance for SVOCs at the FTA. The main locations where SVOCs have been detected include MW-5, MW-9, and MW-10, with trace detections at MW-14. Five SVOC analytes were detected in four of the 12 sampled groundwater wells in the September 2015 sampling event; however, no concentrations were detected above the MCL or regional screening levels (RSL). Naphthalene was detected at a concentration below the RSL at MW-9, while 2-Methylnaphthalene and Hexachlorocyclopentadiene were detected below the RSL at MW-206.

4.3.4 Poly- and Perfluoroalkyl Substances

PFAS have been found in some firefighting foams and are considered an emerging contaminant. PFAS include perfluorooctanesulfonic acid (also known as perfluorooctane sulfonate [PFOS]) and perfluorooctanoic acid (PFOA). PFAS have not been investigated at the FTA before 2012; however, it is possible that firefighting foam containing PFAS were used in firefighting activities at the FTA. PFOA and PFOS are fully fluorinated organic compounds and are the two perfluorinated chemicals most commonly found in firefighting reagents.

Groundwater samples obtained from wells during the most recent sampling event (September 2015) exhibited the following detected PFOA results: MW-1 (0.015 µg/L); MW-210 (0.012 µg/L); DP-35 (0.018 µg/L); MW-14 (0.350 µg/L); MW-5 (0.30 µg/L); MW-9 (0.021 µg/L); MW-11 (0.017 µg/L); MW-10 (0.022 µg/L), and MW-12 (0.0056 µg/L). Groundwater samples obtained from wells in September 2015 exhibited the following detected PFOS results: MW-10 (0.011 µg/L); MW-1 (0.0016 µg/L); MW-9 (0.14 µg/L); MW-11 (0.15 µg/L); and MW-12 (0.011 µg/L).

Results from the September 2015 sampling effort revealed that samples collected from MW-9 and MW-11 exhibited PFOS in excess of the USEPA's Lifetime Drinking Water Health Advisory Level (HAL) of 0.07 µg/L (USEPA 2016). The HAL for PFOS is protective of drinking water quality, and not groundwater from monitoring wells.

4.3.5 Total and Dissolved Metals

Historically, the primary metal COPCs in soil, sediment, surface water, and groundwater samples include chromium and manganese along with other trace metals.

Results from the metals analysis on groundwater samples have shown that the maximum concentrations of chromium and manganese were found in the northern portion of the site

(hydraulically downgradient of the rest of the site). These include 6.7 µg/L of chromium detected at MW-1 and 3,850 µg/L of manganese detected at MW-9.

5.0 HISTORICAL DATA TRENDS

Section 5.0 compares groundwater data collected in 2015 with groundwater data collected between 2007 and 2014 (**Table F-3**). **Figure F-5** shows groundwater analytical results in excess of the PSLs for the 2015 groundwater data.

The groundwater samples from the monitoring wells collected in 2012, 2014 and 2015 were analyzed for perfluorinated compounds (PFCs), as part of the new emerging-contaminant protocol. Results from the PFC sampling efforts have shown that the maximum concentrations of PFAS (as PFOS and PFOA) were found in the northern portion of the site (hydraulically downgradient) in MW-11 (250 nanograms per liter [ng/L] PFOS) and MW-14 (450 ng/L PFOA). No significant historic trends in PFOS or PFOA concentrations are observed in FTA monitoring wells.

Historically, the primary metal COPCs at FTA in soil, sediment, surface water samples include chromium and manganese along with other trace metals. Results from the metals analysis on groundwater samples have shown that the maximum concentrations of chromium and manganese were found in the northern portion of the site (hydraulically downgradient) in MW-05 and MW-9. The highest concentration of chromium was detected at MW-11 in 2014 at a concentration of 4.67 µg/L. The highest manganese concentration was detected at MW-9 in 2012 at a concentration of 3,460 µg/L. No significant historic trends in metals concentrations are observed in FTA monitoring wells.

The results show that there is no current polychlorinated biphenyl (PCB) contamination in groundwater as of 2015, which historically was the main contaminant of concern in other media.

6.0 CONCLUSIONS AND LIMITATIONS

This sampling event has defined the limits of the contamination at the FTA; identified the nature and extent of contamination in groundwater; and collected data of acceptable quality to adequately define the potential risks to human health and the environment from these areas. The results have shown that there is no current PCB contamination in groundwater as of 2015, which historically was the main contaminant of concern in other media, and that there are no significant historic trends in contaminant concentrations observed in FTA monitoring wells.

Notes:

< - Result not detected above laboratory reporting limit.
CAS - Chemical Abstracts Service.
FD - Field duplicate.
ft - feet.
J - Estimated value.
N - Normal sample.
SVOC - Semivolatile organic compound.
TPH - Total Petroleum Hydrocarbon.
ug/L - microgram per liter.
U - Not detected.
VOC - Volatile organic compound.
(a) Total concentrations for use in the risk assessment were calculated per sample by summing only the detected individual compounds (i.e., xylene) concentrations. For samples without any detections of individual compounds (i.e., xylene), the maximum reporting detection limit within the sample is presented as a non-detect value. Calculated totals have a CAS number beginning with "RA-".

Notes:

< - Result not detected above laboratory reporting limit.
CAS - Chemical Abstracts Service.
FD - Field duplicate.
ft - feet.
J - Estimated value.
N - Normal sample.
TPH - Total Petroleum Hydrocarbon.
ug/L - microgram per liter.
U - Not detected.
UJ - The analyte was not detected; and the reporting limit is approximate.
UR - Unreported/rejected.
VOC - Volatile organic compound.
(a) Total concentrations for use in the risk assessment were calculated per sample by summing only the detected individual compounds (i.e., xylene) concentrations. For samples without any detections of individual compounds (i.e., xylene), the maximum reporting detection limit within the sample is presented as a non-detect value. Calculated totals have a CAS number beginning with "RA-".

Notes:

< - Result not detected above laboratory reporting limit.
CAS - Chemical Abstracts Service.
F - Filtered sample.
FD - Field duplicate.
ft - feet.
J - Estimated value.
HPAH - High molecular weight PAH.
LPAH - Low molecular weight PAH.
N - Normal sample.
PAH - Polycyclic Aromatic Hydrocarbon.
PCB - Polychlorinated Biphenyl.
SVOC - Semivolatile organic compound.
TPH - Total Petroleum Hydrocarbon.
ug/L - microgram per liter.
U - Not detected.
UJ - The analyte was not detected; and the reporting limit is approximate.
UR - Unreported/rejected.
VOC - Volatile organic compound.
VPH - Volatile Petroleum Hydrocarbons.
(a) Lab calculated value; only used when individual compound data not available.
(b) Total concentrations for use in the risk assessment were calculated per sample by summing only the detected individual compounds (i.e., Aroclor/PAH/xylene) concentrations. For samples without any detections of individual compounds (i.e., Aroclor/PAH/xylene), the maximum reporting detection limit within the sample is presented as a non-detect value. Calculated totals have a CAS number beginning with "RA-".

Notes:

< - Result not detected above laboratory reporting limit.
CAS - Chemical Abstracts Service.
F - Filtered sample.
FD - Field duplicate.
ft - feet.
J - Estimated value.
HPAH - High molecular weight PAH.
LPAH - Low molecular weight PAH.
N - Normal sample.
PAH - Polycyclic Aromatic Hydrocarbon.
PCB - Polychlorinated Biphenyl.
SVOC - Semivolatile organic compound.
TPH - Total Petroleum Hydrocarbon.
ug/L - microgram per liter.
U - Not detected.
UJ - The analyte was not detected; and the reporting limit is approximate.
UR - Unreported/rejected.
VOC - Volatile organic compound.
VPH - Volatile Petroleum Hydrocarbons.
(a) Lab calculated value; only used when individual compound data not available.
(b) Total concentrations for use in the risk assessment were calculated per sample by summing only the detected individual compounds (i.e., Aroclor/PAH/xylene) concentrations. For samples without any detections of individual compounds (i.e., Aroclor/PAH/xylene), the maximum reporting detection limit within the sample is presented as a non-detect value. Calculated totals have a CAS number beginning with "RA-".

Notes:
< - Result not detected above laboratory reporting limit.
CAS - Chemical Abstracts Service.
F - Filtered sample.
FD - Field duplicate.
ft - feet.
J - Estimated value.
HPAH - High molecular weight PAH.
LPAH - Low molecular weight PAH.
N - Normal sample.
PAH - Polycyclic Aromatic Hydrocarbon.
PCB - Polychlorinated Biphenyl.
SVOC - Semivolatile organic compound.
TPH - Total Petroleum Hydrocarbon.
ug/L - microgram per liter.
U - Not detected.
UJ - The analyte was not detected; and the reporting limit is approximate.
UR - Unreported/rejected.
VOC - Volatile organic compound.
VPH - Volatile Petroleum Hydrocarbons.
(a) Lab calculated value; only used when individual compound data not available.
(b) Total concentrations for use in the risk assessment were calculated per sample by summing only the detected individual compounds (i.e., Aroclor/PAH/xylene) concentrations. For samples without any detections of individual compounds (i.e., Aroclor/PAH/xylene), the maximum reporting detection limit within the sample is presented as a non-detect value. Calculated totals have a CAS number beginning with "RA-".

Data Validation Report

Project:	Cutler FTA	
Laboratory:	Katahdin Laboratories	
Service Request:	Navy Clean	
Analyses/Method:	Lead by Inductively Coupled Plasma (ICP)/SW-846 6010C; MA-EPH; MA-VPH; PCBs SW8082; Volatiles by SW8260; Semivolatiles by SW8270 SIM	
Validation Level:	Limited	
AECOM Project Number:	60285299	
Prepared by:	Devon Chicoine/AECOM Technical Services, Inc.	Completed on: November 5, 2015
Reviewed by:		File Name: CutlerWE31-3_memo

SUMMARY

The samples listed as follows were collected by AECOM Technical Services, Inc. (AECOM) from Cutler, Maine (Cutler) Fire Training Area in September 2015.

Table of Samples Analyzed

SDG	Sample ID	Lab Sample ID	Matrix/Sample Type
S15145	FTA-TB-091515	SI7223-1	Trip Blank
S15145	FTA-MW-9-091515	SI7223-2	Ground Water
S15145	FTA-MW-1-091815	SI7375-001	Ground Water

S15145	FTA-TB-092115	SI7420-1	Trip Blank

Notes:
ID – identification
SDG – sample delivery group

Quality control (QC) validation criteria were derived from the Tier I Sampling And Analysis Plan (SAP) Naval Computer and Telecommunications Area Master Station Atlantic Detachment Cutler, Maine, AECOM, Revision 0, June 2015; the *DoD Quality Systems Manual for Environmental Laboratories, Version 5.0* (July 2013); and USEPA publication: *Test Methods for Evaluating Solid Waste, Physical/Chemical Methods SW846*, (Final Update III, December 1996), specifically SW-846 methods 6010C and 7470 for mercury and SW-846 Methods 5035A/8000B. Validation actions were derived primarily from *USEPA Contract Laboratory Program National Functional Guidelines for Superfund Organic Methods Data Review* (June 2008) and *USEPA Contract Laboratory Program National Functional Guidelines for Inorganic Superfund Data Review, January 2010* and AECOM professional judgment were also considered.

REVIEW ELEMENTS

The data were evaluated based on the following parameters (where applicable to the method):

- ✓ Data completeness (chain-of-custody (COC)/sample integrity
- ✓ Holding times and sample preservation
- ✓ Instrument tuning
- ✓ Initial calibration/continuing calibration verification (specific to methods 8330A
- ✓ Laboratory blanks/trip blanks (VOCs)/equipment blanks
- ✓ Surrogate spike recoveries (specific to methods 8330A)
- ✓ ICP Interference Check Sample (ICSA/ICSAB) (specific to method 6010C)
- ✓ Matrix spike (MS/matrix spike duplicate (MSD) results
- ✓ Laboratory duplicate results (specific to method 6010C)
- ✓ Laboratory control sample (LCS)/laboratory control sample duplicate (LCSD) results
- ✓ Serial Dilution (specific to method 6010C)
- ✓ Field duplicates
- ✓ Internal Standards
- ✓ Sample results/reporting issues

Any QC nonconformance that resulted in the qualification of data is discussed below. In addition, nonconformances or other issues that were noted during validation, but did not result in qualification of data, may be discussed for informational purposes only.

Based on the scope of the validation, the data are valid as reported and may be used for decision making purposes. Selected data points were estimated and/or negated due to nonconformances of certain QC criteria (see discussion below). No data were rejected as a result of data validation.

ORGANICS RESULTS

1.0 VOLATILES

1.1 Data Completeness

The data package was reviewed and found to meet acceptance criteria for completeness:

- The COCs were reviewed for completeness of information relevant to the samples and requested analyses, and for signatures indicating transfer of sample custody.
- The laboratory sample login sheet(s) were reviewed for issues potentially affecting sample integrity, including the condition of sample containers upon receipt at the laboratory.
- Completeness of analyses was verified by comparing the reported results to the COC requests.

1.2 Holding Times/Sample Preservation

Sample preservation and preparation/analysis holding times were reviewed for conformance with the QC acceptance criteria. The samples were received at the laboratory within the $\leq$6°C temperature criteria. All the samples were analyzed within the 14-day holding time for the preserved samples. The QC acceptance criteria were met.

1.3 Initial Calibration/Continuing Calibration Verification

Calibration data were reviewed for conformance with the QC acceptance criteria to ensure that:

- the initial calibration (ICAL) percent relative standard deviation (%RSD), correlation coefficient (r)/coefficient of determination (r^2), and/or response factor method acceptance criteria were met;
- the appropriate number of standards were included in the ICAL;
- the initial calibration verification (ICV) percent recovery (%R) criteria were met;
- the continuing calibration verification standard (CCV) method percent difference or percent drift (%Ds) and RF acceptance criteria were met;
- ICAL, ICV and CCVs were analyzed at the appropriate concentration and frequency; and
- The retention time method acceptance criteria were met.

The QC acceptance criteria were met.

1.4 Laboratory Blanks/Equipment Blanks/Trip Blanks

Laboratory method blanks were analyzed at the appropriate frequency of 1 per 20 samples and at least 1 per preparatory batch. Laboratory method blanks, equipment rinsate and trip blanks were evaluated as to whether there were contaminants detected above 1/2 the reporting limit (RL) and above 1/10 the amount measured in any sample or 1/10 the regulatory limit (whichever is greater). For common laboratory contaminants (acetone, 2-butanone and methylene chloride) evaluation was based on analytes detected above the RL, consistent with the Quality control (QC) validation criteria specified in the project SAP.

Data validation qualifications for individual samples are based on the maximum contaminant concentration detected in all associated blanks.

Method, equipment rinsate, and trip blank results were reviewed for conformance with the QC acceptance criteria. Target analytes detected in blanks are not discussed in this data validation report if the associated results were non-detect or if qualification of sample results was not required.

Trace results for the following samples were blank-qualified as estimated and non-detected (UJ) at the reported concentrations due to sample results less than ten-times the concentrations reported in the associated method blanks: no analytes were detected in trip blanks or method blanks.

1.5 Surrogate Spike Recoveries

Sample FTA-MW-5-091815, FTA-MW-1-091815, and FTA-MW-14-092115-D had high recoveries of the surrogate dibromofluoromethane (SW8260 SIM) which exceeded the acceptance limit of 130%. Since a high recovery which indicated a high bias and there were no target analytes detected above the MDL, no qualification is necessary.

FTA-MW-14-092115, FTA-MW-10-092115, FTA-MW-208-092115, FTA-MW-12-092115, and FTA-DP-35-092115 had high recoveries of the surrogates 1,2-dichloroethane-d4 and dibromofluoromethane (SW8260) which exceeded the acceptance limit of 130%. Since a high recovery which indicated a high bias and there were no target analytes detected above the MDL, no qualification is necessary.

1.6 Matrix Spike/Matrix Spike Duplicates (MS/MSDs)

The MS/MSD %Rs and relative percent differences (RPDs) were reviewed for conformance with the QC acceptance criteria. Project specific MS/MSD %Rs for target analytes were within laboratory control sample acceptance criteria. MS and MSD %Rs were not applicable for samples when native concentrations exceeded 4x the spiked amount. Organic MS/MSD %Rs must both be outside of QC limits in order for organic results to be qualified based on matrix. If organic matrix effect was not confirmed (either MS or MSD was compliant), data did not require qualification. MS/MSD %Rs

from non-project samples were considered, but were not utilized to qualify project samples since matrix similarity to project samples could not be guaranteed.

Sample FTA-MW-210-092115 had high MS/MSD recoveries in isopropylbenzene; however, the LCS was acceptable. No qualification is necessary.

1.7 Laboratory Control Samples/Laboratory Control Sample Duplicates (LCS/LCSDs)

The LCS/LCSD %Rs and/or RPDs were reviewed for conformance with the QC acceptance criteria. An LCS was included in each analytical batch. Recoveries were within QC acceptance criteria specified by DoD QSM v 5.0. All QC acceptance criteria were met except for tetrachloroethene in samples FTA-MW-11-092115 and FTA-MW-14-092115-D. Samples were flagged J.

1.8 Field Duplicate Results

Field duplicate RPDs were reviewed for conformance with a QC acceptance criterion of $\leq$35% for ground water matrices. Field duplicate RPDs were within data validation QC limits, or RPDs were not applicable due to results that were within $\pm$ the reporting limit or were undetected in both samples, except as noted. Field duplicate and native sample concentrations that were both undetected are not reflected as follows since RPDs are not applicable.

1.9 Sample Results/Reporting Issues

Non-detect results were reported at the LOD. All compounds detected at concentrations less than the LOQ but greater than the DL were qualified by the laboratory as estimated (J). This J qualifier was retained during data validation.

Any sample that was analyzed at a dilution due to high concentrations of target or non-targets was checked to ensure that the results and/or sample specific LOQs were adjusted accordingly by the laboratory. Reported detection limits are achievable by the quoted methods, and are in compliance with the project requirements. Some samples required dilution due to high concentrations of target analytes or interference. The reporting limits for diluted results were raised appropriately.

2.0 MA VPH

2.1 Data Completeness

The data package was reviewed and found to meet acceptance criteria for completeness:

- The COCs were reviewed for completeness of information relevant to the samples and requested analyses, and for signatures indicating transfer of sample custody.
- The laboratory sample login sheet(s) were reviewed for issues potentially affecting sample integrity, including the condition of sample containers upon receipt at the laboratory.
- Completeness of analyses was verified by comparing the reported results to the COC requests.

2.2 Holding Times/Sample Preservation

Sample preservation and preparation/analysis holding times were reviewed for conformance with the QC acceptance criteria. The samples were received at the laboratory within the $\leq$6°C temperature criteria. All the samples were analyzed within the 28-day holding time for the preserved samples. The QC acceptance criteria were met.

2.3 Initial Calibration/Continuing Calibration Verification

Calibration data were reviewed for conformance with the QC acceptance criteria to ensure that:

- the initial calibration (ICAL) percent relative standard deviation (%RSD), correlation coefficient (r)/coefficient of determination (r^2), and/or response factor method acceptance criteria were met;
- the appropriate number of standards were included in the ICAL;
- the initial calibration verification (ICV) percent recovery (%R) criteria were met;
- the continuing calibration verification standard (CCV) method percent difference or percent drift (%Ds) and RF acceptance criteria were met;
- ICAL, ICV and CCVs were analyzed at the appropriate concentration and frequency; and
- The retention time method acceptance criteria were met.

The QC acceptance criteria were met.

2.4 Laboratory Blanks/Equipment Blanks/Trip Blanks

Laboratory method blanks were analyzed at the appropriate frequency of 1 per 20 samples and at least 1 per preparatory batch. Laboratory method blanks, equipment rinsate and trip blanks were evaluated as to whether there were contaminants detected above 1/2 the reporting limit (RL) and above 1/10 the amount measured in any sample or 1/10 the regulatory limit (whichever is greater). For common laboratory contaminants (acetone, 2-butanone and methylene chloride) evaluation

was based on analytes detected above the RL, consistent with the Quality control (QC) validation criteria specified in the project SAP.

Data validation qualifications for individual samples are based on the maximum contaminant concentration detected in all associated blanks.

Method, equipment rinsate, and trip blank results were reviewed for conformance with the QC acceptance criteria. Target analytes detected in blanks are not discussed in this data validation report if the associated results were non-detect or if qualification of sample results was not required.

2.5 Surrogate Spike Recoveries

The surrogate recoveries (%Rs) were reviewed for conformance with the QC acceptance criteria.

2.6 Matrix Spike/Matrix Spike Duplicates (MS/MSDs)

The MS/MSD %Rs and relative percent differences (RPDs) were reviewed for conformance with the QC acceptance criteria. Project specific MS/MSD %Rs for target analytes were within laboratory control sample acceptance criteria.

2.7 Laboratory Control Samples/Laboratory Control Sample Duplicates (LCS/LCSDs)

The LCS/LCSD %Rs and/or RPDs were reviewed for conformance with the QC acceptance criteria. An LCS was included in each analytical batch. Recoveries were within QC acceptance criteria specified by DoD QSM v 5.0. All QC acceptance criteria were met. Data qualification was not required.

2.8 Field Duplicate Results

Field duplicate RPDs were reviewed for conformance with a QC acceptance criterion of $\leq$35% for soil matrices. Field duplicate RPDs were within data validation QC limits, or RPDs were not applicable due to results that were within $\pm$ the reporting limit or were undetected in both samples, except as noted. Field duplicate and native sample concentrations that were both undetected are not reflected as follows since RPDs are not applicable.

2.9 Sample Results/Reporting Issues

Non-detect results were reported at the LOD. All compounds detected at concentrations less than the LOQ but greater than the DL were qualified by the laboratory as estimated (J). This J qualifier was retained during data validation.

Any sample that was analyzed at a dilution due to high concentrations of target or non-targets was checked to ensure that the results and/or sample specific LOQs were adjusted accordingly by the laboratory. Reported detection limits are achievable by the quoted methods, and are in compliance with the project requirements. Some samples required dilution due to high concentrations of target analytes or interference. The reporting limits for diluted results were raised appropriately.

ORGANICS RESULTS

3.0 SEMIVOLATILES

3.1 Data Completeness

The data package was reviewed and found to meet acceptance criteria for completeness:

- The COCs were reviewed for completeness of information relevant to the samples and requested analyses, and for signatures indicating transfer of sample custody.
- The laboratory sample login sheet(s) were reviewed for issues potentially affecting sample integrity, including the condition of sample containers upon receipt at the laboratory.
- Completeness of analyses was verified by comparing the reported results to the COC requests.

3.2 Holding Times/Sample Preservation

Sample preservation and preparation/analysis holding times were reviewed for conformance with the QC acceptance criteria. The samples were received at the laboratory within the $\leq$6°C temperature criteria. All the samples were analyzed within the 40-day holding time for the preserved samples. The QC acceptance criteria were met.

3.3 Initial Calibration/Continuing Calibration Verification

Calibration data were reviewed for conformance with the QC acceptance criteria to ensure that:

- the initial calibration (ICAL) percent relative standard deviation (%RSD), correlation coefficient (r)/coefficient of determination (r^2), and/or response factor method acceptance criteria were met;
- the appropriate number of standards were included in the ICAL;
- the initial calibration verification (ICV) percent recovery (%R) criteria were met;
- the continuing calibration verification standard (CCV) method percent difference or percent drift (%Ds) and RF acceptance criteria were met;
- ICAL, ICV and CCVs were analyzed at the appropriate concentration and frequency; and
- The retention time method acceptance criteria were met.

The QC acceptance criteria were met.

3.4 Laboratory Blanks/Equipment Blanks/Trip Blanks

Laboratory method blanks were analyzed at the appropriate frequency of 1 per 20 samples and at least 1 per preparatory batch. Laboratory method blanks, equipment rinsate and trip blanks were evaluated as to whether there were contaminants detected above 1/2 the reporting limit (RL) and

above 1/10 the amount measured in any sample or 1/10 the regulatory limit (whichever is greater). For common laboratory contaminants (acetone, 2-butanone and methylene chloride) evaluation was based on analytes detected above the RL, consistent with the Quality control (QC) validation criteria specified in the project SAP.

Data validation qualifications for individual samples are based on the maximum contaminant concentration detected in all associated blanks.

Method, equipment rinsate, and trip blank results were reviewed for conformance with the QC acceptance criteria. Target analytes detected in blanks are not discussed in this data validation report if the associated results were non-detect or if qualification of sample results was not required.

3.5 Surrogate Spike Recoveries

Samples FTA-MW-1-091815, FTA-MW-218-091815 had recoveries for two or more surrogates that were outside the acceptance criteria. The samples were re-extracted within hold time, analyzed, and had similar surrogate deviations. The first set of data was used.

3.6 Matrix Spike/Matrix Spike Duplicates (MS/MSDs)

The MS/MSD %Rs and relative percent differences (RPDs) were reviewed for conformance with the QC acceptance criteria. Project specific MS/MSD %Rs for target analytes were within laboratory control sample acceptance criteria except for 2-METHYLPHENOL and CAPROLACTAM (method SW8270) and 1,1'-BIPHENYL, 2-CHLOROPHENOL, 3,3'-DICHLOROBENZIDINE, BIS(2-ETHYLHEXYL) PHTHALATE, CRESOLS, M & P, DIBENZO(A,H)ANTHRACENE, INDENO(1,2,3-CD)PYRENE, and N-NITROSO-DI-N-PROPYLAMINE in sample FTA-MW-210-092115. These analytes were qualified J.

3.7 Laboratory Control Samples/Laboratory Control Sample Duplicates (LCS/LCSDs)

The LCS/LCSD %Rs and/or RPDs were reviewed for conformance with the QC acceptance criteria. An LCS was included in each analytical batch. Recoveries were within QC acceptance criteria specified by DoD QSM v 5.0. All QC acceptance criteria were met except for 2-methylphenol and caprolactam (method SW8270) in samples FTA-DP-35-092115, FTA-MW-10-092115, FTA-MW-1-091815, FTA-MW-12-092115, FTA-MW-14-092115, FTA-MW-14-092115-D, FTA-MW-206-091815, FTA-MW-206-091815-D, and FTA-MW-218-091815. All QC acceptance criteria were met except for 1,1'-biphenyl (method SW8270_SIM) in samples FTA-DP-35-092115, FTA-MW-10-092115, FTA-MW-1-091815, FTA-MW-12-092115, FTA-MW-14-092115, FTA-MW-14-092115-D, FTA-MW-206-091815, FTA-MW-206-091815-D, FTA-MW-218-091815, FTA-MW-5-091815, and FTA-MW-9-091515. Samples were flagged J.

3.8 Field Duplicate Results

Field duplicate RPDs were reviewed for conformance with a QC acceptance criterion of $\leq$35% for ground water matrices. Field duplicate RPDs were within data validation QC limits, or RPDs were

not applicable due to results that were within $\pm$ the reporting limit or were undetected in both samples, except as noted. Field duplicate and native sample concentrations that were both undetected are not reflected as follows since RPDs are not applicable.

3.9 Sample Results/Reporting Issues

Non-detect results were reported at the LOD. All compounds detected at concentrations less than the LOQ but greater than the DL were qualified by the laboratory as estimated (J). This J qualifier was retained during data validation.

Any sample that was analyzed at a dilution due to high concentrations of target or non-targets was checked to ensure that the results and/or sample specific LOQs were adjusted accordingly by the laboratory. Reported detection limits are achievable by the quoted methods, and are in compliance with the project requirements. Some samples required dilution due to high concentrations of target analytes or interference. The reporting limits for diluted results were raised appropriately.

4.0 MA EPH

4.1 Data Completeness

The data package was reviewed and found to meet acceptance criteria for completeness:

- The COCs were reviewed for completeness of information relevant to the samples and requested analyses, and for signatures indicating transfer of sample custody.
- The laboratory sample login sheet(s) were reviewed for issues potentially affecting sample integrity, including the condition of sample containers upon receipt at the laboratory.
- Completeness of analyses was verified by comparing the reported results to the COC requests.

4.2 Holding Times/Sample Preservation

Sample preservation and preparation/analysis holding times were reviewed for conformance with the QC acceptance criteria. The samples were received at the laboratory within the $\leq$6°C temperature criteria. All the samples were analyzed within the 40-day holding time for the preserved samples. The QC acceptance criteria were met.

4.3 Initial Calibration/Continuing Calibration Verification

Calibration data were reviewed for conformance with the QC acceptance criteria to ensure that:

- the initial calibration (ICAL) percent relative standard deviation (%RSD), correlation coefficient (r)/coefficient of determination (r^2), and/or response factor method acceptance criteria were met;
- the appropriate number of standards were included in the ICAL;
- the initial calibration verification (ICV) percent recovery (%R) criteria were met;
- the continuing calibration verification standard (CCV) method percent difference or percent drift (%Ds) and RF acceptance criteria were met;
- ICAL, ICV and CCVs were analyzed at the appropriate concentration and frequency; and
- The retention time method acceptance criteria were met.

The QC acceptance criteria were met.

4.4 Laboratory Blanks/Equipment Blanks/Trip Blanks

Laboratory method blanks were analyzed at the appropriate frequency of 1 per 20 samples and at least 1 per preparatory batch. Laboratory method blanks, equipment rinsate and trip blanks were evaluated as to whether there were contaminants detected above 1/2 the reporting limit (RL) and above 1/10 the amount measured in any sample or 1/10 the regulatory limit (whichever is greater). For common laboratory contaminants (acetone, 2-butanone and methylene chloride) evaluation

was based on analytes detected above the RL, consistent with the Quality control (QC) validation criteria specified in the project SAP.

Data validation qualifications for individual samples are based on the maximum contaminant concentration detected in all associated blanks.

Method, equipment rinsate, and trip blank results were reviewed for conformance with the QC acceptance criteria. Target analytes detected in blanks are not discussed in this data validation report if the associated results were non-detect or if qualification of sample results was not required.

4.5 Surrogate Spike Recoveries

Sample FTA-MW-14-092115, FTA-MW-14-092115-D, and FTA-DP-35-092115 had low recoveries for the extraction surrogate 5-alpha androstane. The samples were re-extracted within hold time with similar deviations confirming a matrix effect. The first set of data was used.

4.6 Matrix Spike/Matrix Spike Duplicates (MS/MSDs)

The MS/MSD %Rs and relative percent differences (RPDs) were reviewed for conformance with the QC acceptance criteria. Project specific MS/MSD %Rs for target analytes were within laboratory control sample acceptance criteria.

4.7 Laboratory Control Samples/Laboratory Control Sample Duplicates (LCS/LCSDs)

The LCS/LCSD %Rs and/or RPDs were reviewed for conformance with the QC acceptance criteria. An LCS was included in each analytical batch. Recoveries were within QC acceptance criteria specified by DoD QSM v 5.0. All QC acceptance criteria were met. Data qualification was not required.

4.8 Field Duplicate Results

Field duplicate RPDs were reviewed for conformance with a QC acceptance criterion of $\leq$35% for ground water matrices. Field duplicate RPDs were within data validation QC limits, or RPDs were not applicable due to results that were within $\pm$ the reporting limit or were undetected in both samples, except as noted. Field duplicate and native sample concentrations that were both undetected are not reflected as follows since RPDs are not applicable.

4.9 Sample Results/Reporting Issues

Non-detect results were reported at the LOD. All compounds detected at concentrations less than the LOQ but greater than the DL were qualified by the laboratory as estimated (J). This J qualifier was retained during data validation.

Any sample that was analyzed at a dilution due to high concentrations of target or non-targets was checked to ensure that the results and/or sample specific LOQs were adjusted accordingly by the laboratory. Reported detection limits are achievable by the quoted methods, and are in compliance

with the project requirements. Some samples required dilution due to high concentrations of target analytes or interference. The reporting limits for diluted results were raised appropriately.

5.0 POLYCHLORINATED BIPHENYLS

5.1 Data Completeness

The data package was reviewed and found to meet acceptance criteria for completeness:

- The COCs were reviewed for completeness of information relevant to the samples and requested analyses, and for signatures indicating transfer of sample custody.
- The laboratory sample login sheet(s) were reviewed for issues potentially affecting sample integrity, including the condition of sample containers upon receipt at the laboratory.
- Completeness of analyses was verified by comparing the reported results to the COC requests.

5.2 Holding Times/Sample Preservation

Sample preservation and preparation/analysis holding times were reviewed for conformance with the QC acceptance criteria. The samples were received at the laboratory within the $\leq$6°C temperature criteria. All the samples were analyzed within the 40-day holding time for the preserved samples. The QC acceptance criteria were met.

5.3 Initial Calibration/Continuing Calibration Verification

Calibration data were reviewed for conformance with the QC acceptance criteria to ensure that:

- the initial calibration (ICAL) percent relative standard deviation (%RSD), correlation coefficient (r)/coefficient of determination (r^2), and/or response factor method acceptance criteria were met;
- the appropriate number of standards were included in the ICAL;
- the initial calibration verification (ICV) percent recovery (%R) criteria were met;
- the continuing calibration verification standard (CCV) method percent difference or percent drift (%Ds) and RF acceptance criteria were met;
- ICAL, ICV and CCVs were analyzed at the appropriate concentration and frequency; and
- The retention time method acceptance criteria were met.

The QC acceptance criteria were met.

5.4 Laboratory Blanks/Equipment Blanks/Trip Blanks

Laboratory method blanks were analyzed at the appropriate frequency of 1 per 20 samples and at least 1 per preparatory batch. Laboratory method blanks, equipment rinsate and trip blanks were evaluated as to whether there were contaminants detected above 1/2 the reporting limit (RL) and above 1/10 the amount measured in any sample or 1/10 the regulatory limit (whichever is greater). For common laboratory contaminants (acetone, 2-butanone and methylene chloride) evaluation

was based on analytes detected above the RL, consistent with the Quality control (QC) validation criteria specified in the project SAP.

Data validation qualifications for individual samples are based on the maximum contaminant concentration detected in all associated blanks.

Method, equipment rinsate, and trip blank results were reviewed for conformance with the QC acceptance criteria. Target analytes detected in blanks are not discussed in this data validation report if the associated results were non-detect or if qualification of sample results was not required.

5.5 Surrogate Spike Recoveries

The surrogate recoveries (%Rs) were reviewed for conformance with the QC acceptance criteria.

5.6 Matrix Spike/Matrix Spike Duplicates (MS/MSDs)

The MS/MSD %Rs and relative percent differences (RPDs) were reviewed for conformance with the QC acceptance criteria. Project specific MS/MSD %Rs for target analytes were within laboratory control sample acceptance criteria.

5.7 Laboratory Control Samples/Laboratory Control Sample Duplicates (LCS/LCSDs)

The LCS/LCSD %Rs and/or RPDs were reviewed for conformance with the QC acceptance criteria. An LCS was included in each analytical batch. Recoveries were within QC acceptance criteria specified by DoD QSM v 5.0. All QC acceptance criteria were met. Data qualification was not required.

5.8 Field Duplicate Results

Field duplicate RPDs were reviewed for conformance with a QC acceptance criterion of $\leq$35% for ground water matrices. Field duplicate RPDs were within data validation QC limits, or RPDs were not applicable due to results that were within $\pm$ the reporting limit or were undetected in both samples, except as noted. Field duplicate and native sample concentrations that were both undetected are not reflected as follows since RPDs are not applicable.

5.9 Sample Results/Reporting Issues

Non-detect results were reported at the LOD. All compounds detected at concentrations less than the LOQ but greater than the DL were qualified by the laboratory as estimated (J). This J qualifier was retained during data validation.

Any sample that was analyzed at a dilution due to high concentrations of target or non-targets was checked to ensure that the results and/or sample specific LOQs were adjusted accordingly by the laboratory. Reported detection limits are achievable by the quoted methods, and are in compliance with the project requirements. Some samples required dilution due to high concentrations of target analytes or interference. The reporting limits for diluted results were raised appropriately.

INORGANIC RESULTS

6.0 METALS (6010C)

6.1 Data Completeness

The data package was reviewed and found to meet acceptance criteria for completeness:

- The COCs were reviewed for completeness of information relevant to the samples and requested analyses, and for signatures indicating transfer of sample custody.
- The laboratory sample login sheet(s) were reviewed for issues potentially affecting sample integrity, including the condition of sample containers upon receipt at the laboratory.
- Completeness of analyses was verified by comparing the reported results to the COC requests.

6.2 Holding Times/Sample Preservation

Sample preservation and preparation/analysis holding times were reviewed for conformance with the QC acceptance criteria. The samples were received at the laboratory within the $\leq$6°C temperature criteria, preserved with HNO3 to pH <2. All the samples were analyzed within the 180-day holding time (28 days for Hg) for the preserved samples. The QC acceptance criteria were met.

6.3 ICP Performance Checks

The data were reviewed to ensure that the Inductively Coupled Plasma (ICP) tune was performed at the correct frequency and that the method acceptance criteria were met. The Percent Relative Standard Deviation (%RSD) of the absolute signal for all 6010C analytes in the tuning solution were < 5%. The QC acceptance criteria were met.

6.4 Laboratory Blanks/Equipment Blanks

Laboratory method blanks and equipment rinsate blanks were evaluated as to whether there were contaminants detected above 1/2 the reporting limit (RL) and above 1/10 the amount measured in any sample or 1/10 the regulatory limit (whichever is greater). Data validation qualifications for individual samples are based on the maximum contaminant concentration detected in all associated blanks.

Method and equipment rinsate results were reviewed for conformance with the QC acceptance criteria. Detected results in blanks are not discussed in this data validation report if the associated results were or if qualification of sample results was not required.

6.5 Matrix Spike/Matrix Spike Duplicates (MS/MSDs)

The MS/MSD %Rs and relative percent differences (RPDs) were reviewed for conformance with the QC acceptance criteria. Project specific MS/MSD %Rs for target analytes were within SAP specified

QC limits of 80-120% for metal analytes, or MS/MSD data met the following requirements, except calcium (FTA-MW-210-ground water092115); flagged J+.

6.6 Laboratory Control Samples/Laboratory Control Sample Duplicates (LCS/LCSDs)

The LCS/LCSD %Rs and/or RPDs were reviewed for conformance with the QC acceptance criteria. An LCS was included in each analytical batch. Recoveries were within QC acceptance criteria specified by DoD QSM v 5.0. All QC acceptance criteria were met. Data qualification was not required.

6.7 Field Duplicate Results

Field duplicate RPDs were reviewed for conformance with a QC acceptance criterion of $\leq$35% for groundwater matrices. Field duplicate RPDs were within data validation QC limits, or RPDs were not applicable due to results that were within $\pm$ the reporting limit or were undetected in both samples, except as noted.

6.8 Sample Results/Reporting Issues

Non-detect results were reported at the LOD. All compounds detected at concentrations less than the LOQ but greater than the DL were qualified by the laboratory as estimated (J). This J qualifier was retained during data validation.

Any sample that was analyzed at a dilution due to high concentrations of target or non-targets was checked to ensure that the results and/or sample specific LOQs were adjusted accordingly by the laboratory. Reported detection limits are achievable by the quoted methods, and are in compliance with the project requirements. Some samples required dilution due to high concentrations of target analytes or interference. The reporting limits for diluted results were raised appropriately.

The post-digestion spiked sample recovery of lead in sample FTA-MW-210-092115 was not within control limits. The sample was flagged J+.

7.0 PRECISION, ACCURACY, METHOD COMPLIANCE, AND COMPLETENESS ASSESSMENT

7.1 Precision

Precision is the measure of variability between individual sample measurements. Field precision was determined by comparison of field duplicate sample results (where applicable). Laboratory precision was determined by examination of laboratory duplicate results. MS/MSD pairs measure both field and laboratory precision. Evaluation of duplicates for precision was done using the Relative Percent Difference (RPD). The RPD is defined as the difference between two duplicate samples divided by the mean and expressed as a percent. RPD limits referenced SAP published QC limits. Data that required qualification based calculated field duplicate RPDs, are discussed in **Section 1.0**. Overall field and laboratory precision is acceptable since majority of the data is unqualified and no data is rejected based on these measurements.

7.2 Accuracy

Field accuracy, a measure of the sampling bias, was determined by reviewing field blank and trip blank results for evidence of sample contamination stemming from sampling activities and/or sample transport/bottle contamination. Laboratory accuracy is a measure of the system bias, and was measured by evaluating laboratory control sample/laboratory control sample duplicate (LCS/LCSD), matrix spike/matrix spike duplicate (MS/MSD), and organic system monitoring compounds (surrogate) percent recoveries (%Rs). LCS/LCSD %Rs, which demonstrated the overall performance of the analytical procedure, were compared to published or recommended SAP QC limits. MS/MSD %Rs, which provided information on sample matrix interferences were compared to SAP published QC limits or laboratory control charted limits. System monitoring compound or surrogate recoveries, which measured system performance and efficiency during organic analysis, were compared to SAP published QC limits. Data that required qualification based on surrogate, matrix spike, or other outliers are discussed in **Section 1.0**. Overall field and laboratory accuracy is acceptable since majority of the data is unqualified and no data is rejected based on these measurements.

7.3 Compliance

For this sample set, method compliance was determined by evaluating sample integrity, preservation, holding time, laboratory blanks and calibration against method specified requirements, while applying EPA data validation guidelines. No data require qualification based on method compliance measurements and overall method compliance is acceptable based on the data reported.

7.4 Completeness

Completeness is the overall ratio of the number of samples planned versus the number of samples with valid analyses. Completeness goals are set at 90-100%. Determination of completeness included a review of chain of custody records, laboratory analytical methods and detection limits,

laboratory case narratives and project requirements. Completeness also included 100% review of the laboratory sample data results and electronic data deliverables (EDDs).

All reported data was usable with qualification and the completeness of the data set was calculated to be within the set goal of 90% -100% and determined to be acceptable.

Qualifier Codes and Explanations

Qualifier	Explanation
J	The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample.
J+	The result is an estimated quantity, but the result may be biased high.
J-	The result is an estimated quantity, but the result may be biased low.
UJ	The analyte was not detected above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the actual limit of quantitation necessary to accurately and precisely measure the analyte in the sample.
U	The analyte was analyzed for but was not detected above the reported sample quantitation limit.
R	The sample results are rejected due to serious deficiencies in the ability to analyze the sample and meet quality control criteria. The presence or absence of the analyte cannot be verified.

WHITE PAPER: EVALUATION OF CHROMIUM IN SOIL AND SEDIMENT AT NCTAMS LANT DET CUTLER

The following is a discussion regarding the presence or absence of hexavalent chromium in surface soil and sediment at the Fire Training Area (FTA) and soil at the Salvage Yard Area (SYA) at the Naval Computer and Telecommunications Area Master Station Atlantic Detachment (NCTAMS LANT Det) Cutler (Cutler) facility in Maine.

In November 2016, the following samples were collected at the installation and analyzed for trivalent chromium and hexavalent chromium. Trivalent chromium (Cr^{3+}) calculations were also provided and the analytical data is provided in Attachment A.

- FTA - 10 soil samples, 1 sediment sample
- SYA - 10 soil samples
- Very Low Frequency (VLF) Peninsula - 10 soil samples

While hexavalent chromium was not detected in any of soil samples from the FTA or SYA, the limits of detection (LOD) were elevated due to matrix interference, and the analytical data could not be used to eliminate hexavalent chromium as a chemical of potential concern.

Because the analytical results are inconclusive in determining whether chromium is present in its hexavalent state above the risk-based screen level (RSL) of 0.3 milligrams per kilogram (mg/kg), multiple lines of reasoning are used to support the weight-of-evidence conclusion that hexavalent chromium is not an anthropogenic site-related contaminant at the FTA or SYA:

- Site History
- Background Concentrations of Metals in Soils
- Soil Characteristics
- Analytical Method
  - Matrix Interference
  - Moisture Content
- Quality Control Samples

The discussion also includes data from the VLF Peninsula where hexavalent chromium was detected at concentrations above the LOD and exceeded the RSL.

This white paper evaluates the site background, site conditions, and analytical processes to determine if conditions exist for chromium to be present in the hexavalent state.

1.0 SITE HISTORY

There are no reported uses of chromium at the FTA and SYA either in a manufacturing process or primary waste storage or disposal. The FTA is an abandoned gravel pit that was historically used for fire-training exercises by NCTAMS LANT Det Cutler personnel from the 1960s through the 1980s. FTA includes the Drum Disposal Area (DDA). A total of 76 drums were removed from the DDA site and residual PCB contamination was identified. Additionally, there are no known sources from usage of chromium containing materials. The SYA was used as a temporary repository and storage area for materials awaiting offsite transport. Wastes gathered at the SYA included lube oils, electronic equipment, batteries, asbestos, paint cans, and drums of waste lube oil and other petroleum products. Several removal actions were performed between 1999 and 2003 and included the removal of buried debris including: remnants of an offsite trailer, rusty metal scrap, PCB contaminated and petroleum contaminated soil and sand blast grit.

2.0 BACKGROUND CONCENTRATIONS OF METALS IN SOIL

Chromium exists in two common oxidation states: trivalent chromium (chromium-3, Cr[III], or Cr^{3+}) and hexavalent chromium (chromium-6, Cr[VI], or Cr^{6+}). Cr^{3+} compounds are hardly soluble in water, while most Cr^{6+}compounds are readily soluble in water (USEPA, 1995). Cr^{3+} is the dominant form occurring in the soil in the State of Maine, and is therefore expected to be present at these sites. Cr^{6+} can also be naturally occurring in soil; however, as described below, chromium in this state is unstable given the geologic conditions and is not expected to exist at concentrations that exceed the RSL.

Table 1 summarizes the 2016 total chromium results for the FTA, SYA and VLF Peninsula along with two sources of background data: 1) for the State of Maine, and 2) for the NCTAMS LANT Det Cutler facility. The background study for Cutler includes two soil Groups: Group "A" where 12 soil samples were collected from an area of approximately 14,300 acres, and Group "C" where 10 soil samples were collected from an area of approximately 4,600 acres. Group "A" covers the adjacent peninsula, located east of the NCTAMS LANT Det Installation and includes the Towns of Little Machias and Cutler, and extends west to the border of the Cutler Coast Public Reserved Land. The Group "C" area encompasses the FTA and SYA sites along its southern extent north to include the High Frequency Area. No background soil samples were collected on the property of the VLF Peninsula, but the background report says that VLF Peninsula soil is likely a mixture of Group "A" and Group "C" soil types.

Table 1: Total Chromium in Site and Background Soil

Study	Reference	Minimum (mg/kg)	Maximum (mg/kg)	Mean (mg/kg)
FTA 2016 Soil Sampling	[a]	19.5	32.9	24.7
FTA 2016 Sediment Sampling	[a]	17.2	17.2	—

Table 1: Total Chromium in Site and Background Soil				
Study	**Reference**	**Minimum (mg/kg)**	**Maximum (mg/kg)**	**Mean (mg/kg)**

a Resolution Consultant sampling in November 2016.

b Summary Report for Evaluation of Concentrations of Polycyclic Aromatic Hydrocarbons (PAHs) and Metals in Background soils in Maine, November 2012.

c Installation Restoration Sites at NCTAMSLANT Det Cutler, Maine, March 2005.

As shown above, the levels of total chromium detected in surface soil samples from the two sites are consistent with the levels expected in Maine and, more specifically, from samples collect on the installation. **Figures 1** and **2** present the total chromium result from the 2016 sampling for the FTA and the SYA sites, respectively. Additionally, the pattern of chromium detections appears to be random across each of these sites with no distinct areas with higher chromium levels that would indicate a release location.

3.0 SOIL CHARACTERISTICS

The soil characteristics at the sites play an important role in the fate and transport of chromium. The overburden materials encountered at the FTA consist generally of medium to coarse sand with lesser amounts of gravel and silt overlying a confining layer of silty clay. A peat layer is exposed at the surface in the northern portion of the site. The surface geology at the SYA is similar with what appears to be a sand/gravel deposit location in the central portion of the site.

The predominant soil type underlying both the FTA and SYA sites is the *Pits, sand and gravel* (U.S. Department of Agriculture Soil Conservation Service, 2016). This soil consists of sediments deposited mainly as glaciofluvial sands and gravels with some glacial till. Soil pH measured for the FTA site indicates that the *Pits* is an acidic soil. The pH measurements from 19 surface soils collected at the FTA range from 4.5 to 7.1 with the most frequent pH value being 5.4. Both sites are bordered to the north by the *Bucksport and Wonsqueak mucks* (peat layers) and to the south by the *Colton gravelly sandy loam*. The *Bucksport and Wonsqueak* consists of swamp deposits with highly decomposed organic material which are strongly acid with pH ranging from 3.6 to 5.5. The *Colton gravelly sandy loam* has a soil pH ranging from 3.6 to 6.0 (U.S. Department of Agriculture Soil Conservation Services, 2016).

The acidic soil conditions present at the FTA and SYA sites are not conducive to the presence of chromium in its hexavalent state. Hexavalent chromium is a strong oxidant and is reduced in the presence of electron donors. Electron donors commonly found in soils include ferrous iron minerals, reduced sulfur, and soil organic matter. Organic matter is present at both sites in the form of peat layers and organic silts and high iron levels have been measured in soil as is discussed in Part 4.1. The reduction reaction from Cr^{6+} to Cr^{3+} is very fast on the time scale for most environmental concerns, with a complete reaction in less than 5 minutes even in the presence of dissolved oxygen in the soil moisture (Eary and Rai, 1988). This rapid reaction was observed during the preparation of quality control samples as part of the analysis for hexavalent chromium as discussed in Part 5.

4.0 ANALYTICAL METHOD

A discussion of the analytical methods used to prepare and analyze the soil and sediment samples is useful because of what can be learned about the soil conditions. Method 3060A is an alkaline extraction which raises the sample pH and fixes the concentrations and thereby the ratio of Cr^{3+}/Cr^{6+} and prevents conversion of valence state in either direction. Soil samples must be digested prior to analysis to solubilize the hexavalent chromium without oxidizing the existing trivalent chromium or reducing any hexavalent chromium present. Method 7196A uses an aliquot of the extraction and mixes it with the indicator chemical diphenylcarbazide in acid solution. A spectrophotometer (turned to a frequency of 540 nanometers) is then used to analyze the sample. As required by the method, quality control samples are used to evaluate the samples for matrix interferences. As discussed below there were significant matrix interferences for the FTA and SYA sites, which suggest that when Cr^{6+} was added to the samples to create the matrix spikes, the Cr^{6+} was converted to Cr^{3+} within minutes and before the laboratory could fix the sample through the extraction process.

4.1 Matrix Interference

Several metals can cause interference with Method 7196A which is the colorimetric method used to analyze the November 2016 soil samples for hexavalent chromium. Metals causing interference include: iron, vanadium, and mercury. The iron concentrations at the sites are high enough to cause the analytical interference (see **Table 2**).

Table 2: Metals at FTA, SYA, and VLF Peninsula

Site	Metal	Matrix	Concentration (a)		Notes
			Minimum (mg/kg)	Maximum (mg/kg)	
FTA	Total Chromium	Soil	17.2	32.9	—
	Iron	Soil	17,200	27,300	>1 mg/L may produce a yellow or rust color
	Vanadium	Soil	—	100	Does not exceed 10 times the level of chromium
	Mercury	Soil	—	0.30	Up to 200 mg/L is tolerated
SYA	Total Chromium	Soil	7.1	45	—
	Iron	Soil	10,800	37,700	>1 mg/L may produce a yellow or rust color
	Vanadium	Soil	22	55.9	Does not exceed 10 times the level of chromium
	Mercury	Soil	—	0.23	Up to 200 mg/L is tolerated
VLF	Total Chromium	Soil	22	172	—
	Iron	Sediment*	11,400	92,700	>1 mg/L may produce a yellow or rust color
	Vanadium	Sediment*	16.6	48.7	Does not exceed 10 times the level of chromium
	Mercury	Sediment*	0.02	0.16	Up to 200 mg/L is tolerated

Notes:
— = not applicable/no data
mg/L = milligrams per liter
mg/kg = milligrams per kilogram
* = freshwater sediments samples from 2004
(a) Range of concentrations as presented in the respective Remedial Investigation Reports.

The presence of iron at high concentrations in soil creates reducing conditions that prohibit the existence of chromium in its hexavalent oxidation state. All three sites: FTA, SYA, and VLF Peninsula have iron concentrations in soil above 10,000 mg/kg. This equates to a minimum of approximately 133 mg/L of iron in the liquid portion extracted from the soil samples. A concentration of 1 mg/L of iron is enough to produce a yellow to rust color after the addition of the indicator chemical diphenylcarbazide in acid solution. In accordance with the requirements of EPA Method 3060A, the color change observed by the laboratory necessitated the dilution of the prepared liquid natal by a factor of 20 times. The result was that the lowest LOD achievable for hexavalent chromium was between <0.29 and <0.33 mg/L, which is near the RSL of 0.3 mg/L. However, moisture content is also a factor in determining the LOD.

4.2 Moisture Content

The in-situ moisture content of individual soil and sediment samples affects the calculation of LOD for hexavalent chromium. The LODs reported by the laboratory are typically between 0.29 and 0.33 mg/kg for the hexavalent chromium for soil samples where the moisture is 12 percent or less. For moisture contents greater than 12 percent, the LOD generally increases in step with the increasing moisture content. As shown

in **Table 3** below, samples from the FTA and the SYA had high moisture content. This is particularly noticeable in the FTA sediment sample (88.7% moisture, 10 mg/kg LOD). Interestingly, that sample had one of the lowest total chromium concentrations (17.2 mg/kg).

Table 3: Soil Moisture and LOD

Samples from the FTA			Samples from the SYA			Samples from the VLF		
Moisture (%)	Cr^{6+} LOD (mg/kg)	Cr^{6+} Concentration (mg/kg)	Moisture (%)	Cr^{6+} LOD (mg/kg)	Cr^{6+} Concentration (mg/kg)	Moisture (%)	Cr^{6+} LOD (mg/kg)	Cr^{6+} Concentration (mg/kg)
9.8	0.32	ND	3.4	0.29	ND	12.4	0.47	ND
9.9	0.32	ND	8.3	0.63	ND	13.8	0.47	1.4

Notes:
Shading indicates concentrations near the RSL of 0.3 mg/L.
* Asterisk indicates a sediment sample.
ND = not detected

5.0 QUALITY CONTROL SAMPLES

A matrix spike/matrix spike duplicate sample was analyzed for each group of soil samples for sites FTA, SYA, and VLF Peninsula. Analytical Method 7196A requires that pre-digestion soil samples be spiked with two forms of hexavalent chromium: insoluble (lead chromate) and a soluble (potassium dichromate). The samples then go through the same digestion process as described above (Method 3060A), see Part 4. A color indicator is added to the samples and then analyzed by a spectrophotometer. No hexavalent chromium was detected in the samples spiked with potassium dichromate for all three sites. This means that in the time between spiking the samples with the soluble form of Cr^{6+} and the pre-digestion of the soil sample spike, all of the Cr^{6+} was converted to Cr^{3+}. These tests were repeated using the samples spiked with lead chromate. The lead chromate spiked samples from the FTA and SYA reported recoveries of 33% and 0%, respectively, which is well below the acceptable limit of 75%.

The laboratory report states that "most of the pre-digested matrix spike recoveries are outside of the method acceptable limits, indicating the presence of a reducing condition in the samples that is inimical [antagonistic] to the presence of chromium in the hexavalent oxidation state." The exception was for the VLF Peninsula site where the in-soluble matrix spike was within the require limits which suggests that while in-situ soil conditions at the FTA and SYA are unfavorable to Cr^{6+}, the conditions are less hostile at the VLF Peninsula site. Despite the failure of the pre-digestion of the soil sample spikes at sites FTA and SYA, the sample results are considered to be valid because "the post-digestion matrix recoveries are within the method acceptance limits, indicating that the alkaline digestate are hospitable to the presence of hexavalent chromium." The successful Cr^{6+} matrix spike recovery measured in the post digestion samples strongly indicates that the in-situ acidic soil condition present at these sites was the cause of the poor pre-digestion spike recoveries.

6.0 SUMMARY

The site history of Cutler is fairly well understood and documented. The industrial activities that are known to have occurred do not include the use of chromium in any process or waste stream. This is confirmed by the concentrations and distribution of total chromium data in soil at FTA and SYA; no singular release point is indicated as shown on **Figures 1** and **2**. Total chromium concentrations values are similar to both site-specific and Maine background levels. At the VLF Peninsula, somewhat higher chromium concentrations in soil appear to be related to the stripped paint chips that accumulated on the ground surface around the towers. Prior to the 1980s, many paints of the reds, yellows, oranges and derivatives of these colors, such as some greens, had high lead-chromate content. In the 1980s, due to OSHA regulations, many of the colored paints, as listed above, were reformulated to exclude lead and chromate ingredients (PCRC website).

For the SYA, regardless of the matrix interference (from naturally occurring iron and normal moisture content of the soil), measured total chromium concentrations are within background; and whether the chromium is Cr^{3+} (most likely) or conservatively assumed to be Cr^{6+}, the conclusion remains unchanged, that a release of chromium has not occurred at this site.

The conservative assumption is unwarranted as shown by the laboratory QC procedure of creating and analyzing matrix spike samples using site soil and known quantities of soluble and insoluble Cr^{6+}. In these samples, Cr^{6+} was not detected because it converted to Cr^{3+} even before the extraction could be performed. Additionally, the low soil pH in samples from the *Pits, sand and gravel* further support that chromium will not be present in its hexavalent state.

For risk assessment purposes, the LOD for non-detected Cr^{6+} results are sometime conservatively compared to the human health RSL. For the reasons presented above, LODs in some samples (especially at the SYA) were elevated above the RSL. Thus, this type of comparison has limited value as it is purely speculative, and unsubstantiated by other site data that indicates any chromium present is in the much less toxic Cr^{3+} form.

The one sediment sample collected at the FTA had a particularly elevated LOD due to both matrix interference and high moisture content. As sediment is typically a reflection of the surrounding soil from which it originates, a similar conclusion drawn for soil applies to this medium: no release is indicated, the elevated LOD is an artifact of the sediment matrix and requirements of the analytical method, and any chromium will be present in the trivalent state.
