## INTRODUCTION

The Maine Cancer Registry collects information on all cancer cases diagnosed in Maine according to State Law Title 22, Chapter 255. The 2013 annual report is based on 2010 cancer incidence and 2010 cancer mortality data, the latest years for which data were available at the time of the analysis. The report provides information on the most frequently diagnosed cancer types in Maine.

The purpose of this report is to summarize data on newly diagnosed cases of cancer (incidence) and deaths associated with cancer (mortality) among

Maine residents. Data are presented at the county and public health district levels for all cancer types combined, the top four cancers in Maine (namely: female breast, prostate, lung, and colorectal cancers), and tobacco-related cancers combined (excluding lung cancer).

The information contained in this report may be used in conjunction with other data sources to determine cancer burden and to guide programs and policies targeted at reducing the impact of cancer.

**Summary of Features:** The following is a summary of features added to this report in recent years:

- Charts describing the trends in the mortality due to the top four cancers (namely: female breast, prostate, lung, and colorectal cancers), and tobacco-related cancers combined (excluding lung cancer) in Maine are provided (See pages 21-22, 36-37).
- County-level and public health district-level maps of mortality rates for all cancer types combined are provided (See pages 39-40).
- Data are presented for “tobacco-related cancers” and “obesity-related cancers”.
- Age-specific incidence data are presented for the top four cancer sites in Maine.
- Data are presented for malignant and non-malignant incident cases of brain and other nervous system tumors.

## TECHNICAL NOTES

**Tobacco-related Cancers:** Tobacco-related cancers excluding lung cancer are included in this report due to their increasing clinical and epidemiologic significance. According to a 2008 MMWR surveillance summary (Surveillance for Cancers Associated with Tobacco Use — United States, 1999–2004), tobacco-related cancers are those that are defined by the U.S. Surgeon General as having direct causal relationships to tobacco use. The list of tobacco-related cancers was expanded in 2004 to include the following: lung, laryngeal, oral cavity and pharynx, esophageal, stomach, pancreatic, kidney and renal pelvis, urinary bladder, cervical cancers, and acute myeloid leukemia.

**Obesity-related Cancers:** According to the 2007 expert report published by the World Cancer Research Fund and American Institute of Cancer Research, there is convincing evidence that greater body fat is a cause of adenocarcinoma of the esophagus, as well as cancers of the pancreas, colon, kidney, endometrium, and breast (postmenopausal). Due to the prevalence of obesity in Maine, this group of cancers is included in the annual cancer report again this year.

**Data Sources:** Maine incidence data are obtained from the Maine Cancer Registry. Mortality data for both Maine and the U.S. is provided by the National Center for Health Statistics. Estimates of national incidence data are used for comparisons and are derived from the Surveillance, Epidemiology and End Results (SEER) Program of the National Cancer Institute. The SEER dataset used in this report (SEER 9) represents about 9.4% of the U.S. population.

**Data Analysis:** Counts and rates presented in this report were produced using the following software: Surveillance Research Program, National Cancer Institute SEER\*Stat software ([seer.cancer.gov/seerstat](http://seer.cancer.gov/seerstat)) 8.0.4.

**National Comparisons:** SEER incidence rates and national mortality rates for both whites and all races have been provided to allow an option for comparison by the reader. However due to the predominately white population in Maine, all statistical comparisons in this report involving national estimates are based on rates for whites. These estimates appear under the headings “SEER Whites” and “SEER All races”.

**Rates:** Incidence and mortality rates are calculated per 100,000 population and are age-adjusted to the year 2000 U.S. standard population.

**Confidence Intervals and Statistical Significance:** Ninety-five percent confidence intervals are provided for all rates. If the 95% confidence intervals for two rates overlapped, the incidence rates were considered similar. If the confidence intervals did not overlap, we considered these rates to be significantly different. Maine rates that are higher than nationally comparable rates or county/district rates that are higher than State (Maine) rates are highlighted in orange (■).

**Maine Public Health Districts:** In 2007, the Maine Center for Disease Control and Prevention created eight public health districts, each district made up of one or more counties. For this reason, cancer rates have been calculated for districts in addition to counties. The table above shows the constituent counties of each district.

Public Health District	Constituent Counties
1. Aroostook District	Aroostook County
2. Central District	Kennebec County, Somerset County
3. Cumberland District	Cumberland County
4. Downeast District	Hancock County, Washington County
5. Midcoast District	Lincoln County, Knox County, Sagadahoc County, Waldo County
6. Penquis District	Penobscot County, Piscataquis County
7. Western District	Androscoggin County, Franklin County, Oxford County
8. York District	York County

**Rates by County/District:** More so than at the state level, the number of new cancer cases reported in a county or district varies from year to year, and much of this variation may be due purely to chance. As a result, cancer rates at the county or district level are more likely to vary on an annual basis than at the state level. Counties/districts with smaller populations tend to have greater variation from one time period to the next. In general, when there are less than 30 cancer cases a year in a geographic entity, it can be difficult to distinguish between normal variation and meaningful changes in cancer rates. In this report, multiple years of data are combined when producing the county or district rates. Although combining years can make the rates more reliable, caution must still be used when interpreting county and district rates because of small populations.

**Maps:** We have included maps to present the geographical distribution of ‘All Cancer Combined’ incidence and mortality rates. These maps were prepared at the county as well as the public health district level. Maps were created using ArcGIS v.10 software; the ‘natural breaks’ method was used to categorize the rates.

**Charts:** We have included charts describing trends in cancer incidence and mortality in the State of Maine. The incidence charts show trends in the incidence rates of colorectal cancer, cervical cancer and female breast cancer from 1995 to 2010. The mortality charts show trends in mortality

rates for the top four causes of cancers (lung, colorectal, female breast and prostate) and tobacco-related cancer from 1969 to 2010. Separate cancer mortality trend charts were prepared for males and females due to gender-specific cancers.

## CASE DEFINITIONS

**Incidence Case Definitions:** Incidence data are based on SEER site recode ICD-O-3/WHO 2008 definitions, version 2008: Available at [http://www.seer.cancer.gov/siterecode/icdo3\\_dwho/home/index.html](http://www.seer.cancer.gov/siterecode/icdo3_dwho/home/index.html). Case definitions are included in Appendix 1. Histologies consistent with Kaposi sarcoma and mesothelioma are excluded (where applicable).

**Mortality Case Definitions:** Death data are based on ICD-10 codes for underlying cause of death as defined below:

Site	ICD-10 Codes
All Sites	C00–C97
Brain and Other Nervous Systems	C70-C72
Breast	C50
Cervix Uteri	C53
Colon and Rectum	C18-C20, C26.0

Notes:

- Maine rate is significantly higher than US White rate
- Tobacco-related cancers excl. Lung = laryngeal, oral cavity and pharynx, esophageal, stomach, pancreatic, kidney and renal pelvis, urinary bladder, cervical cancers, and acute myeloid leukemia. These cancers are also reported separately in the table
- Cancer sites are ordered by descending incidence rates
- Incidence case definitions are based on SEER Site Recode ICD-O-3/WHO 2008
- Incidence case definitions exclude histologies consistent with Kaposi sarcoma and mesothelioma, where applicable
- Rates are calculated per 100,000 population and age-adjusted to the year 2000 U.S. standard population
- Abbreviations: AA = Age-adjusted; CI = Confidence Interval; SEER = Surveillance, Epidemiology, and End Results; Excl. = Excluding.
